Welcome to the Amazon S3 Console User Guide

Welcome to the *Amazon Simple Storage Service Console User Guide* for the Amazon Simple Storage Service (Amazon S3) console.

Amazon S3 provides virtually limitless storage on the internet. This guide explains how you can manage buckets, objects, and folders in Amazon S3 by using the AWS Management Console, a browser-based graphical user interface for interacting with AWS services.

For detailed conceptual information about how Amazon S3 works, see [What Is Amazon S3?](#) in the *Amazon Simple Storage Service Developer Guide*. The developer guide also has detailed information about Amazon S3 features and code examples to support those features.

How Do I Change the Language of the Amazon S3 Console?

You can change the display language of the Amazon S3 console. Several languages are supported.

To change the console language

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. Scroll down until you see the bar at the bottom of the window, and then choose the language on the left side of the bar.

3. Choose the language that you want from the menu.

Creating and Configuring an S3 Bucket

To upload your data (photos, videos, documents etc.) to Amazon S3, you must first create an S3 bucket in one of the AWS Regions. You can then upload your data objects to the bucket.

Every object you store in Amazon S3 resides in a bucket. You can use buckets to group related objects in the same way that you use a directory to group files in a file system.

Amazon S3 creates buckets in the AWS Region that you specify. You can choose any AWS Region that is geographically close to you to optimize latency, minimize costs, or address regulatory requirements. For example, if you reside in Europe, you might find it advantageous to create buckets in the EU (Ireland) or EU (Frankfurt) regions. For a list of Amazon S3 AWS Regions, see [Regions and Endpoints](#) in the *Amazon Web Services General Reference*.

You are not charged for creating a bucket. You are only charged for storing objects in the bucket and for transferring objects out of the bucket. For more information about pricing, see [Amazon Simple Storage Service \(S3\) FAQs](#).

Amazon S3 bucket names are globally unique, regardless of the AWS Region in which you create the bucket. You specify the name at the time you create the bucket. For bucket naming guidelines, see [Bucket Restrictions and Limitations](#) in the *Amazon Simple Storage Service Developer Guide*.

The following topics explain how to use the Amazon S3 console to create, delete, and manage buckets.

How Do I Create an S3 Bucket?

Before you can upload data to Amazon S3, you must create a bucket in one of the AWS Regions to store your data in. After you create a bucket, you can upload an unlimited number of data objects to the bucket.

A bucket is owned by the AWS account that created it. By default, you can create up to 100 buckets in each of your AWS accounts. If you need additional buckets, you can increase your account bucket limit to a maximum of 1,000 buckets by submitting a service limit increase. For information about how to increase your bucket limit, see [AWS Service Limits](#) in the *AWS General Reference*.

Buckets have configuration properties, including their geographical region, who has access to the objects in the bucket, and other metadata.

To create an S3 bucket

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. Choose **Create bucket**.

3. On the **Name and region** page, enter a name for your bucket and choose the AWS Region where you want the bucket to reside. Complete the fields on this page as follows:
 - a. For **Bucket name**, enter a unique DNS-compliant name for your new bucket. Follow these naming guidelines:
 - The name must be unique across all existing bucket names in Amazon S3.
 - The name must not contain uppercase characters.
 - The name must start with a lowercase letter or number.
 - The name must be between 3 and 63 characters long.
 - After you create the bucket, you cannot change the name, so choose wisely.
 - Choose a bucket name that reflects the objects in the bucket because the bucket name is visible in the URL that points to the objects that you're going to put in your bucket.

For information about naming buckets, see [Rules for Bucket Naming](#) in the *Amazon Simple Storage Service Developer Guide*.

- b. For **Region**, choose the AWS Region where you want the bucket to reside. Choose a Region close to you to minimize latency and costs, or to address regulatory requirements. Objects stored in a Region never leave that Region unless you explicitly transfer them to another Region. For a list of Amazon S3 AWS Regions, see [Regions and Endpoints](#) in the *Amazon Web Services General Reference*.
- c. (Optional) If you have already set up a bucket that has the same settings that you want to use for the new bucket that you want to create, you can set it up quickly by choosing **Copy settings from an existing bucket**, and then choosing the bucket whose settings you want to copy.

The settings for the following bucket properties are copied: versioning, tags, and logging.

- d. Do one of the following:
 - If you copied settings from another bucket, choose **Create**. You're done, so skip the following steps.
 - If not, choose **Next**.

The screenshot shows the 'Create bucket' wizard in the Amazon S3 console. The wizard is divided into four steps: 1. Name and region, 2. Configure options, 3. Set permissions, and 4. Review. The first step, 'Name and region', is currently active. It contains a 'Bucket name' field with the text 'admin-created' and a 'Region' dropdown menu set to 'US West (Oregon)'. Below these fields is a section titled 'Copy settings from an existing bucket' with a dropdown menu showing '47 Buckets'. At the bottom of the wizard are three buttons: 'Create', 'Cancel', and 'Next'.

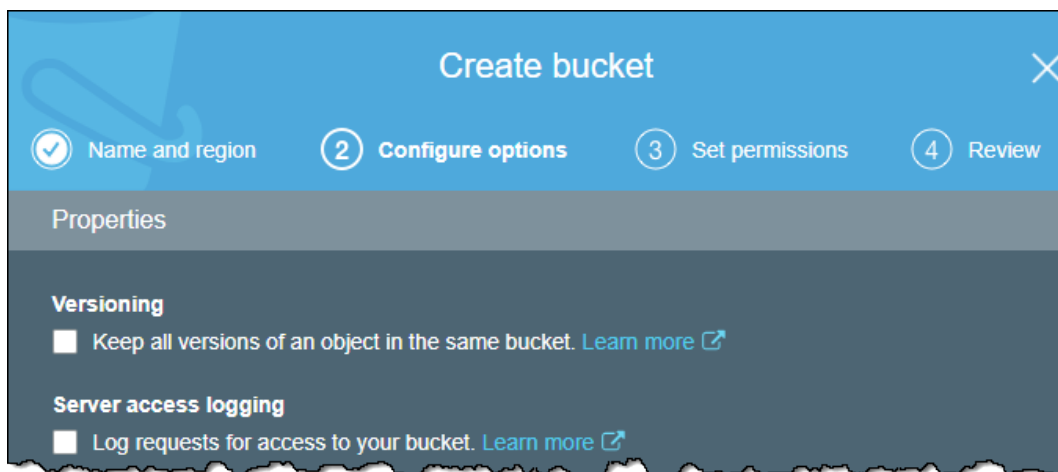

4. On the **Configure options** page, you can configure the following properties and Amazon CloudWatch metrics for the bucket. Or, you can configure these properties and CloudWatch metrics later, after you create the bucket.
 - a. **Versioning**

To enable object versioning for the bucket, select **Keep all versions of an object in the same bucket**.

For more information on enabling versioning, see [How Do I Enable or Suspend Versioning for an S3 Bucket? \(p. 12\)](#).
 - b. **Server access logging**

To enable server access logging on the bucket, select **Log requests for access to your bucket**.

Server access logging provides detailed records for the requests that are made to your bucket. For more information about enabling server access logging, see [How Do I Enable Server Access Logging for an S3 Bucket? \(p. 16\)](#).

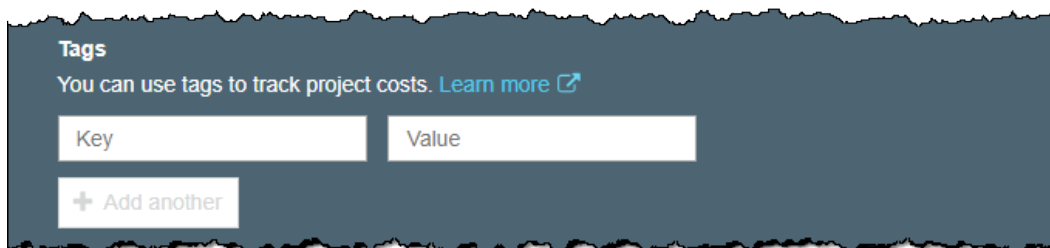

The screenshot shows the 'Create bucket' console window with a blue header. The progress bar at the top indicates four steps: 1. Name and region (checked), 2. Configure options (active), 3. Set permissions, and 4. Review. The 'Properties' section is expanded, showing 'Versioning' and 'Server access logging' options, both with checkboxes and 'Learn more' links.

c. **Tags**

To add a cost allocation bucket tag, enter a *Key* and a *Value*. Choose **Add another** to add another tag.

You can use cost allocation bucket tags to annotate billing for your use of a bucket. Each tag is a key-value pair that represents a label that you assign to a bucket. For more information about cost allocation tags, see [Using Cost Allocation S3 Bucket Tags](#) in the *Amazon Simple Storage Service Developer Guide*.

The screenshot shows the 'Tags' section of the console. It includes a heading 'Tags', a description 'You can use tags to track project costs. Learn more', and two input fields labeled 'Key' and 'Value'. Below these fields is a button labeled '+ Add another'.

d. **Object-level logging**

To enable object-level logging with CloudTrail, select **Record object-level API activity by using CloudTrail for an additional cost**. For more information about enabling object-level logging, see [How Do I Enable Object-Level Logging for an S3 Bucket with AWS CloudTrail Data Events?](#) (p. 19).

e. **Default encryption**

To enable default encryption for the bucket, select **Automatically encrypt objects when they are stored in S3**.

You can enable default encryption for a bucket so that all objects are encrypted when they are stored in the bucket. For more information about enabling default encryption, see [How Do I Enable Default Encryption for an Amazon S3 Bucket?](#) (p. 13).

f. **Object lock**

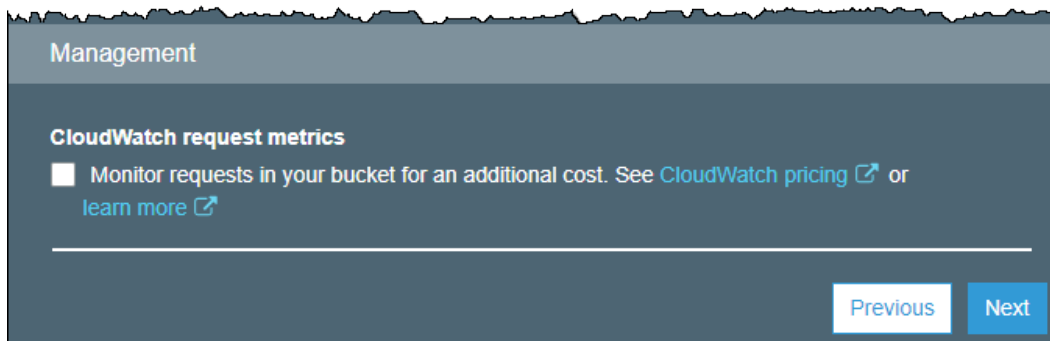

If you want to be able to lock objects in the bucket, select **Permanently allow objects in this bucket to be locked**.

Object lock requires that you enable versioning on the bucket. For more information about object locking, see [Introduction to Amazon S3 Object Lock](#) in the *Amazon Simple Storage Service Developer Guide*.

g. **CloudWatch request metrics**

To configure CloudWatch request metrics for the bucket, select **Monitor requests in your bucket for an additional cost**.

For more information about CloudWatch request metrics, see [How Do I Configure Request Metrics for an S3 Bucket?](#) (p. 109).

5. Choose **Next**.

6. On the **Set permissions** page, you manage the permissions that are set on the bucket that you are creating.

Under **Block public access (bucket settings)**, we recommend that you do not change the default settings that are listed under **Block all public access**. You can change the permissions after you create the bucket. For more information about setting bucket permissions, see [How Do I Set ACL Bucket Permissions?](#) (p. 124). If you intend to use the bucket to host a static website, you can edit the block public access settings after you create it. For more information, see [How Do I Configure an S3 Bucket for Static Website Hosting?](#) (p. 21)

Warning

We highly recommend that you keep the default access settings for blocking public access to the bucket that you are creating. Public access means that anyone in the world can access the objects in the bucket.

If you intend to use the bucket to store Amazon S3 server access logs, in the **Manage system permissions** list, choose **Grant Amazon S3 Log Delivery group write access to this bucket**. For more information about server access logs, see [How Do I Enable Server Access Logging for an S3 Bucket?](#) (p. 16).

Note: You can grant access to specific users after you create the bucket.

Block public access (bucket settings)

Public access is granted to buckets and objects through access control lists (ACLs), bucket policies, or both. In order to ensure that public access to all your S3 buckets and objects is blocked, turn on Block all public access. These settings apply only to this bucket. AWS recommends that you turn on Block all public access, but before applying any of these settings, ensure that your applications will work correctly without public access. If you require some level of public access to your buckets or objects within, you can customize the individual settings below to suit your specific storage use cases. [Learn more](#)

☒ **Block all public access**
Turning this setting on is the same as turning on all four settings below. Each of the following settings are independent of one another.

- ☐ **Block public access to buckets and objects granted through new access control lists (ACLs)**
S3 will block public access permissions applied to newly added buckets or objects, and prevent the creation of new public access ACLs for existing buckets and objects. This setting doesn't change any existing permissions that allow public access to S3 resources using ACLs.
- ☐ **Block public access to buckets and objects granted through any access control lists (ACLs)**
S3 will ignore all ACLs that grant public access to buckets and objects.
- ☐ **Block public access to buckets and objects granted through new public bucket policies**
S3 will block new bucket policies that grant public access to buckets and objects. This setting doesn't change any existing policies that allow public access to S3 resources.
- ☐ **Block public and cross-account access to buckets and objects through any public bucket policies**
S3 will ignore public and cross-account access for buckets with policies that grant public access to buckets and objects.

Manage system permissions

Do not grant Amazon S3 Log Delivery group write access to this bucket

[Previous](#) [Next](#)

When you're done configuring permissions on the bucket, choose **Next**.

7. On the **Review** page, verify the settings. If you want to change something, choose **Edit**. If your current settings are correct, choose **Create bucket**.

- [How Do I Set ACL Bucket Permissions?](#) (p. 124)

How Do I Delete an S3 Bucket?

You can delete an empty bucket, and when you're using the AWS Management Console, you can delete a bucket that contains objects. If you delete a bucket that contains objects, all the objects in the bucket are permanently deleted.

When you delete a bucket with versioning enabled, all versions of all the objects in the bucket are permanently deleted. For more information about versioning, see [Managing Objects in a Versioning-Enabled Bucket](#) in the *Amazon Simple Storage Service Developer Guide*.

Before deleting a bucket, consider the following:

- Bucket names are unique. If you delete a bucket, another AWS user can use the name.
- When you delete a bucket that contains objects, all the objects in the bucket are permanently deleted, including objects that transitioned to the Amazon S3 `GLACIER` storage class.
- If the bucket hosts a static website, and you created and configured an Amazon Route 53 hosted zone as described in [Create and Configure Amazon Route 53 Hosted Zone](#): You must clean up the Route 53 hosted zone settings that are related to the bucket as described in [Delete the Route 53 Hosted Zone](#).

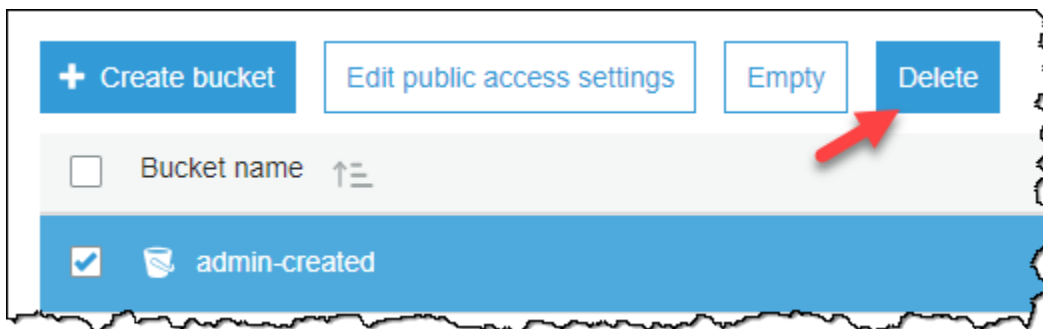

- If the bucket receives log data from Elastic Load Balancing (ELB): We recommend that you stop the delivery of ELB logs to the bucket before deleting it. After you delete the bucket, if another user creates a bucket using the same name, your log data could potentially be delivered to that bucket. For information about ELB access logs, see [Access Logs](#) in the *User Guide for Classic Load Balancers* and [Access Logs](#) in the *User Guide for Application Load Balancers*.

Important

If you want to continue to use the same bucket name, don't delete the bucket. We recommend that you empty the bucket and keep it. After a bucket is deleted, the name becomes available to reuse, but the name might not be available for you to reuse for various reasons. For example, it might take some time before the name can be reused, and some other account could create a bucket with that name before you do.

To delete an S3 bucket

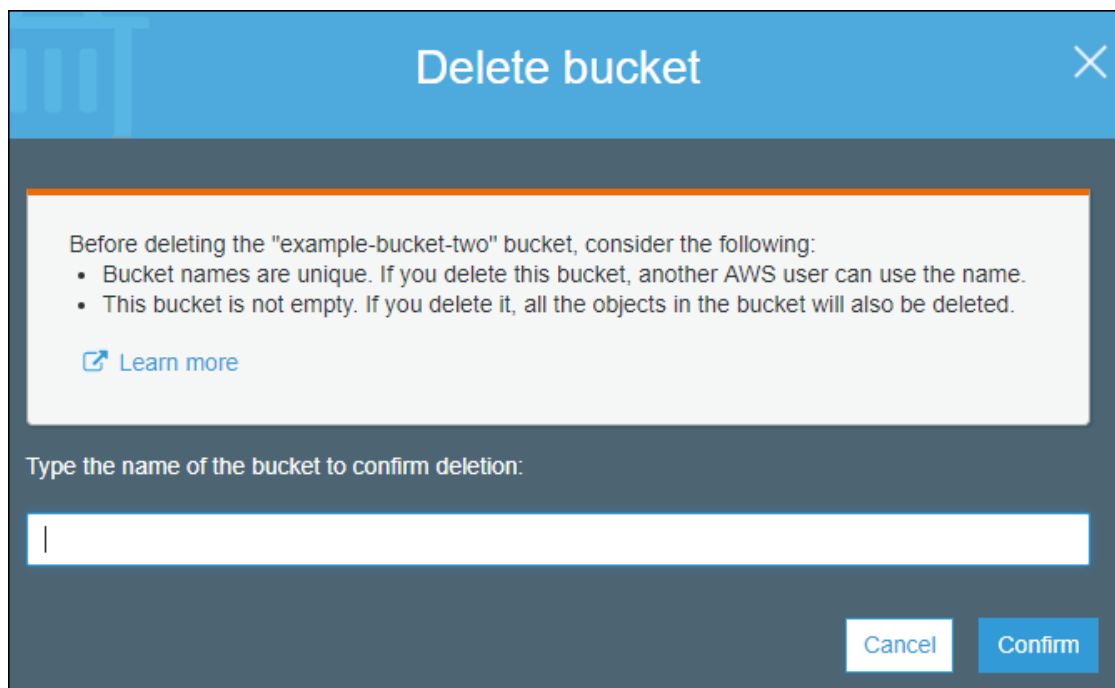

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the bucket icon next to the name of the bucket that you want to delete and then choose **Delete bucket**.

3. In the **Delete bucket** dialog box, type the name of the bucket that you want to delete for confirmation, and then choose **Confirm**.

Note

The text in the dialog box changes depending on whether the bucket is empty, is used for a static website, or is used for ELB access logs.

How Do I Empty an S3 Bucket?

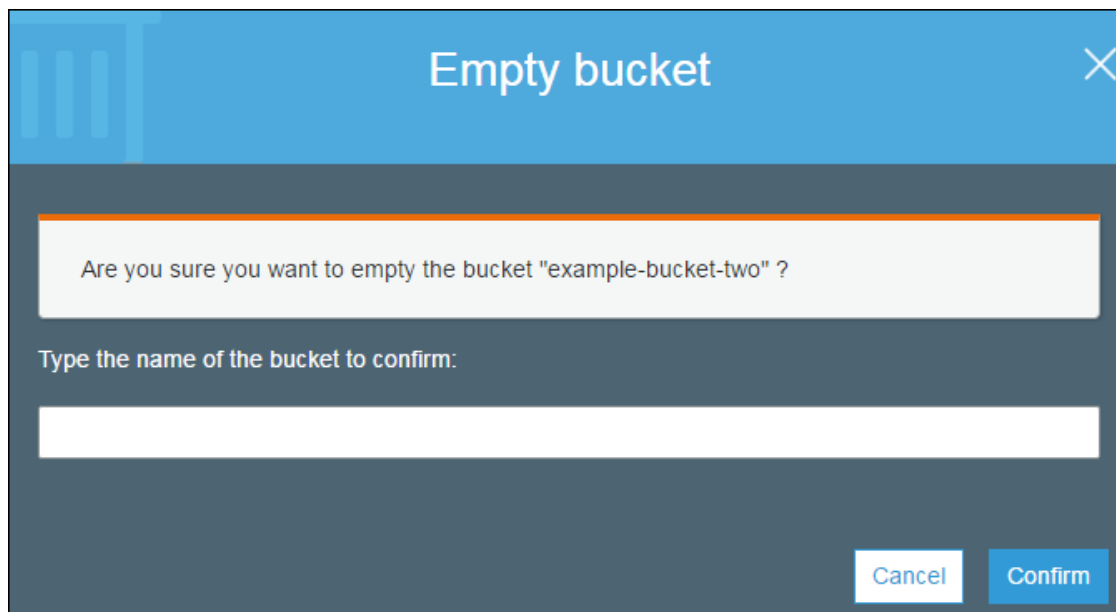

You can empty a bucket, which deletes all of the objects in the bucket without deleting the bucket. When you empty a bucket with versioning enabled, all versions of all the objects in the bucket are deleted. For more information, see [Managing Objects in a Versioning-Enabled Bucket](#) and [Deleting/Emptying a Bucket](#) in the *Amazon Simple Storage Service Developer Guide*.

To empty an S3 bucket

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want to empty and then choose **Empty**.

3. In the **Empty bucket** dialog box, type the name of the bucket you want to empty for confirmation and then choose **Confirm**.

How Do I View the Properties for an S3 Bucket?

This topic explains how to view the properties for an S3 bucket.

To view the properties for an S3 bucket

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want to view the properties for.

3. Choose **Properties**.

4. On the **Properties** page, you can configure the following properties for the bucket.
 - a. **Versioning** – Versioning enables you to keep multiple versions of an object in one bucket. By default, versioning is disabled for a new bucket. For information about enabling versioning, see [How Do I Enable or Suspend Versioning for an S3 Bucket? \(p. 12\)](#).
 - b. **Server access logging** – Server access logging provides detailed records for the requests that are made to your bucket. By default, Amazon S3 does not collect server access logs. For information about enabling server access logging, see [How Do I Enable Server Access Logging for an S3 Bucket? \(p. 16\)](#).
 - c. **Static website hosting** – You can host a static website on Amazon S3. To enable static website hosting, choose **Static website hosting** and then specify the settings you want to use. For more information, see [How Do I Configure an S3 Bucket for Static Website Hosting? \(p. 21\)](#).
 - d. **Object-level logging** – Object-level logging records object-level API activity by using CloudTrail data events. For information about enabling object-level logging, see [How Do I Enable Object-Level Logging for an S3 Bucket with AWS CloudTrail Data Events? \(p. 19\)](#).
 - e. **Tags** – With AWS cost allocation, you can use bucket tags to annotate billing for your use of a bucket. A tag is a key-value pair that represents a label that you assign to a bucket. To add tags, choose **Tags**, and then choose **Add tag**. For more information, see [Using Cost Allocation Tags for S3 Buckets](#) in the *Amazon Simple Storage Service Developer Guide*.
 - f. **Transfer acceleration** – Amazon S3 Transfer Acceleration enables fast, easy, and secure transfers of files over long distances between your client and an S3 bucket. For information about enabling transfer acceleration, see [How Do I Enable Transfer Acceleration for an S3 Bucket? \(p. 33\)](#).
 - g. **Events** – You can enable certain Amazon S3 bucket events to send a notification message to a destination whenever the events occur. To enable events, choose **Events** and then specify the settings you want to use. For more information, see [How Do I Enable and Configure Event Notifications for an S3 Bucket? \(p. 28\)](#).
 - h. **Requester Pays** – You can enable Requester Pays so that the requester (instead of the bucket owner) pays for requests and data transfers. For more information, see [Requester Pays Buckets](#) in the *Amazon Simple Storage Service Developer Guide*.

How Do I Enable or Suspend Versioning for an S3 Bucket?

Versioning enables you to keep multiple versions of an object in one bucket. This section describes how to enable object versioning on a bucket. For more information about versioning support in Amazon S3, see [Object Versioning](#) and [Using Versioning](#) in the *Amazon Simple Storage Service Developer Guide*.

To enable or disable versioning on an S3 bucket

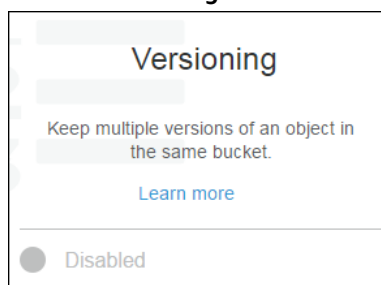

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want to enable versioning for.

3. Choose **Properties**.

4. Choose **Versioning**.

5. Choose **Enable versioning** or **Suspend versioning**, and then choose **Save**.

How Do I Enable Default Encryption for an Amazon S3 Bucket?

Amazon S3 default encryption provides a way to set the default encryption behavior for an Amazon S3 bucket. You can set default encryption on a bucket so that all objects are encrypted when they are stored in the bucket. The objects are encrypted using server-side encryption with either Amazon S3-managed keys (SSE-S3) or AWS Key Management Service (AWS KMS) customer master keys (CMKs).

When you use server-side encryption, Amazon S3 encrypts an object before saving it to disk in its data centers and decrypts it when you download the objects. For more information about protecting data using server-side encryption and encryption key management, see [Protecting Data Using Server-Side Encryption](#) in the *Amazon Simple Storage Service Developer Guide*.

Default encryption works with all existing and new Amazon S3 buckets. Without default encryption, to encrypt all objects stored in a bucket, you must include encryption information with every object storage

request. You must also set up an Amazon S3 bucket policy to reject storage requests that don't include encryption information.

There are no new charges for using default encryption for S3 buckets. Requests to configure the default encryption feature incur standard Amazon S3 request charges. For information about pricing, see [Amazon S3 Pricing](#). For SSE-KMS CMK storage, AWS KMS charges apply and are listed at [AWS KMS Pricing](#).

To enable default encryption on an Amazon S3 bucket

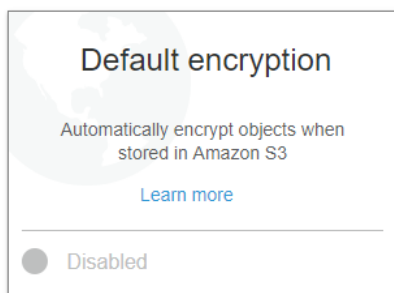

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want.

3. Choose **Properties**.

4. Choose **Default encryption**.

5. If you want to use keys that are managed by Amazon S3 for default encryption, choose **AES-256**, and choose **Save**.

For more information about using Amazon S3 server-side encryption to encrypt your data, see [Protecting Data with Amazon S3-Managed Encryption Keys](#) in the *Amazon Simple Storage Service Developer Guide*.

 - In the list that appears, choose the AWS KMS CMK.
 - In the list that appears, choose **Custom KMS ARN**, and then enter the Amazon Resource Name of the AWS KMS CMK.

Important

When you use an AWS KMS CMK for server-side encryption in Amazon S3, you must choose a symmetric CMK. Amazon S3 only supports symmetric CMKs and not asymmetric CMKs. For more information, see [Using Symmetric and Asymmetric Keys](#) in the *AWS Key Management Service Developer Guide*.

How Do I Enable Server Access Logging for an S3 Bucket?

This topic describes how to enable server access logging for an Amazon S3 bucket using the AWS Management Console. For information about how to enable logging programmatically and details about how logs are delivered, see [Server Access Logging](#) in the *Amazon Simple Storage Service Developer Guide*.

By default, Amazon Simple Storage Service (Amazon S3) doesn't collect server access logs. When you enable logging, Amazon S3 delivers access logs for a source bucket to a target bucket that you choose. The target bucket must be in the same AWS Region as the source bucket and must not have a default retention period configuration.

Server access logging provides detailed records for the requests that are made to an S3 bucket. Server access logs are useful for many applications. For example, access log information can be useful in security and access audits. It can also help you learn about your customer base and understand your Amazon S3 bill.

An access log record contains details about the requests that are made to a bucket. This information can include the request type, the resources that are specified in the request, and the time and date that the request was processed. For more information, see [Server Access Log Format](#) in the *Amazon Simple Storage Service Developer Guide*.

Important

There is no extra charge for enabling server access logging on an Amazon S3 bucket. However, any log files that the system delivers to you will accrue the usual charges for storage. (You can delete the log files at any time.) We do not assess data transfer charges for log file delivery, but we do charge the normal data transfer rate for accessing the log files.

To enable server access logging for an S3 bucket

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want to enable server access logging for.

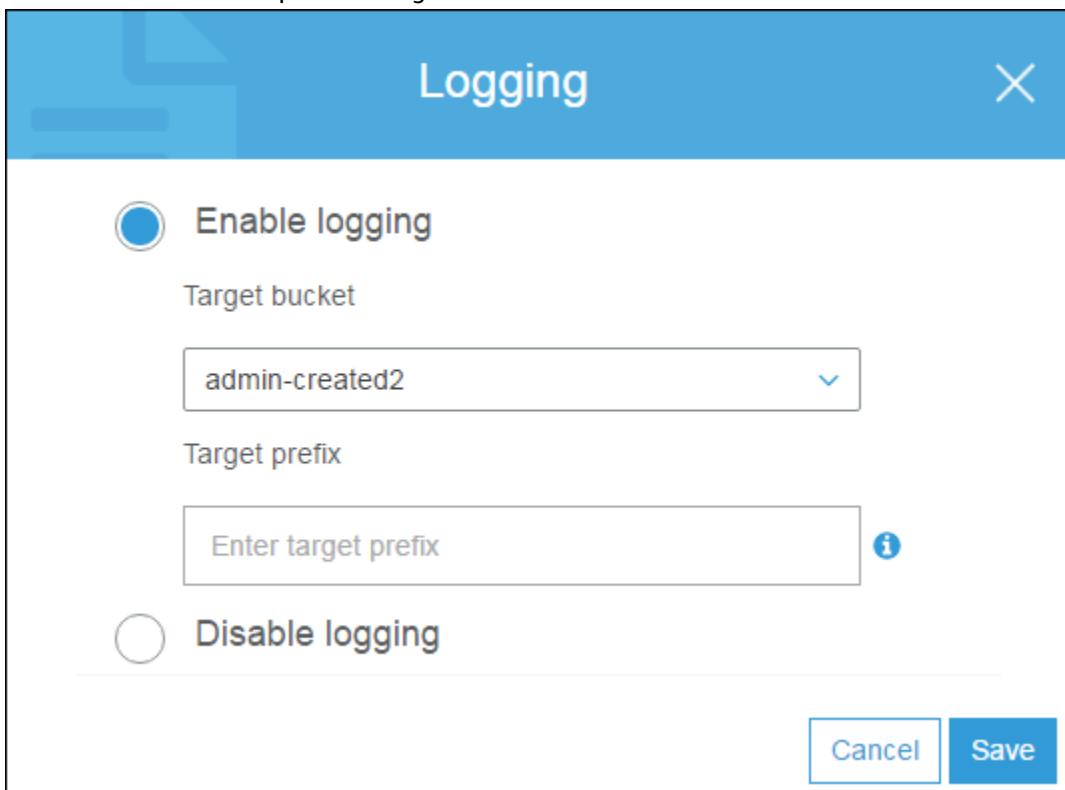

3. Choose **Properties**.

4. Choose **Server access logging**.

5. Choose **Enable Logging**. For **Target**, choose the name of the bucket that you want to receive the log record objects. The target bucket must be in the same Region as the source bucket and must not have a default retention period configuration.

6. (Optional) For **Target prefix**, type a key name prefix for log objects, so that all of the log object names begin with the same string.
7. Choose **Save**.

You can view the logs in the target bucket. If you specified a prefix, the prefix shows as a folder in the target bucket in the console. After you enable server access logging, it might take a few hours before the logs are delivered to the target bucket. How Do I Enable Object-Level Logging for an S3 Bucket with AWS CloudTrail Data Events?

This section describes how to enable an AWS CloudTrail trail to log data events for objects in an S3 bucket by using the Amazon S3 console. CloudTrail supports logging Amazon S3 object-level API operations such as `GetObject`, `DeleteObject`, and `PutObject`. These events are called data events. By default, CloudTrail trails don't log data events, but you can configure trails to log data events for S3 buckets that you specify, or to log data events for all the Amazon S3 buckets in your AWS account.

Important

Additional charges apply for data events. For more information, see [AWS CloudTrail Pricing](#).

To configure a trail to log data events for an S3 bucket, you can use either the AWS CloudTrail console or the Amazon S3 console. If you are configuring a trail to log data events for all the Amazon S3 buckets in your AWS account, it's easier to use the CloudTrail console. For information about using the CloudTrail console to configure a trail to log S3 data events, see [Data Events](#) in the *AWS CloudTrail User Guide*.

The following procedure shows how to use the Amazon S3 console to enable a CloudTrail trail to log data events for an S3 bucket.

To enable CloudTrail data events logging for objects in an S3 bucket

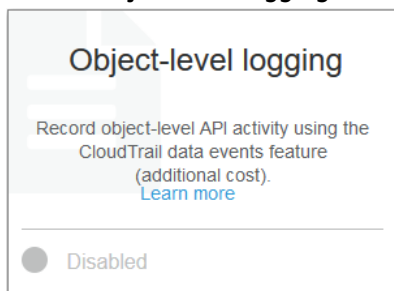

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want.

3. Choose **Properties**.

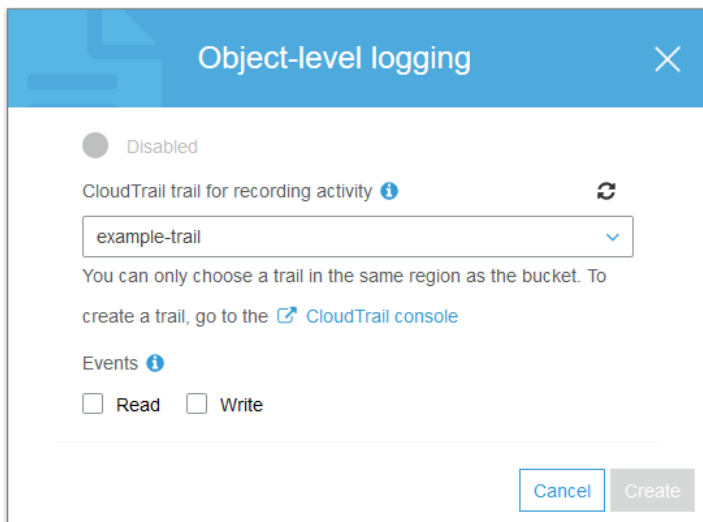

4. Choose **Object-level logging**.

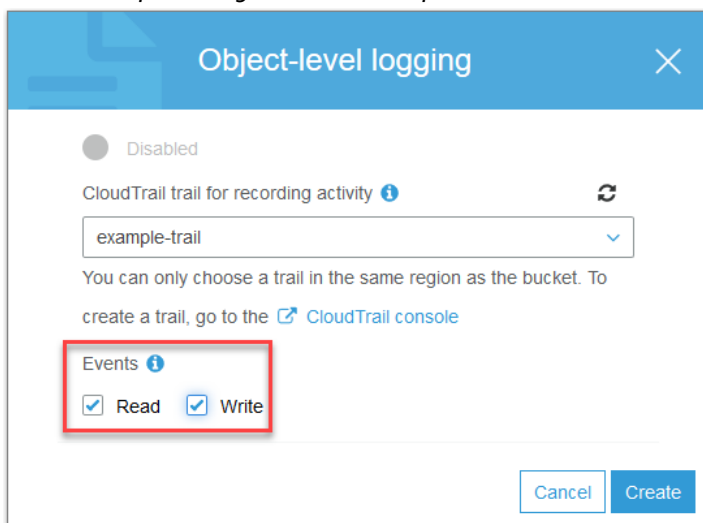

5. Choose an existing CloudTrail trail in the drop-down menu. The trail you select must be in the same AWS Region as your bucket, so the drop-down list contains only trails that are in the same Region as the bucket or trails that were created for all Regions.

If you need to create a trail, choose the **CloudTrail console** link to go to the CloudTrail console. For information about how to create trails in the CloudTrail console, see [Creating a Trail with the Console](#) in the *AWS CloudTrail User Guide*.

- Under **Events**, select **Read** to specify that you want CloudTrail to log Amazon S3 read APIs such as `GetObject`. Select **Write** to log Amazon S3 write APIs such as `PutObject`. Select both **Read** and **Write** to log both read and write object APIs. For a list of supported data events that CloudTrail logs for Amazon S3 objects, see [Amazon S3 Object-Level Actions Tracked by CloudTrail Logging](#) in the *Amazon Simple Storage Service Developer Guide*.

- Choose **Create** to enable object-level logging for the bucket.

To disable object-level logging for the bucket, you must go to the CloudTrail console and remove the bucket name from the trail's **Data events**.

Note

If you use the CloudTrail console or the Amazon S3 console to configure a trail to log data events for an S3 bucket, the Amazon S3 console shows that object-level logging is enabled for the bucket.

For information about enabling object-level logging when you create an S3 bucket, see [How Do I Create an S3 Bucket? \(p. 3\)](#).

How Do I Configure an S3 Bucket for Static Website Hosting?

You can host a static website on Amazon S3. On a static website, individual webpages include static content, and they might also contain client-side scripts. By contrast, a dynamic website relies on server-side processing, including server-side scripts such as PHP, JSP, or ASP.NET. Amazon S3 does not support server-side scripting.

The following is a quick procedure to configure an Amazon S3 bucket for static website hosting in the Amazon S3 console. If you're looking for more in-depth information, and walkthroughs on using a custom domain name for your static website or speeding up your website, see [Hosting a Static Website on Amazon S3](#) in the *Amazon Simple Storage Service Developer Guide*.

To configure an S3 bucket for static website hosting

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want to enable static website hosting for.

3. Choose **Properties**.

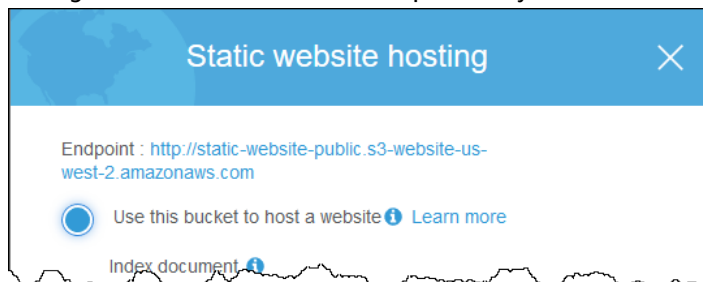

4. Choose **Static website hosting**.

5. Choose **Use this bucket to host a website**.

After you enable your bucket for static website hosting, web browsers can access all of your content through the Amazon S3 website endpoint for your bucket.

- a. In **Index document**, enter the name of the index document, which is typically `index.html`.

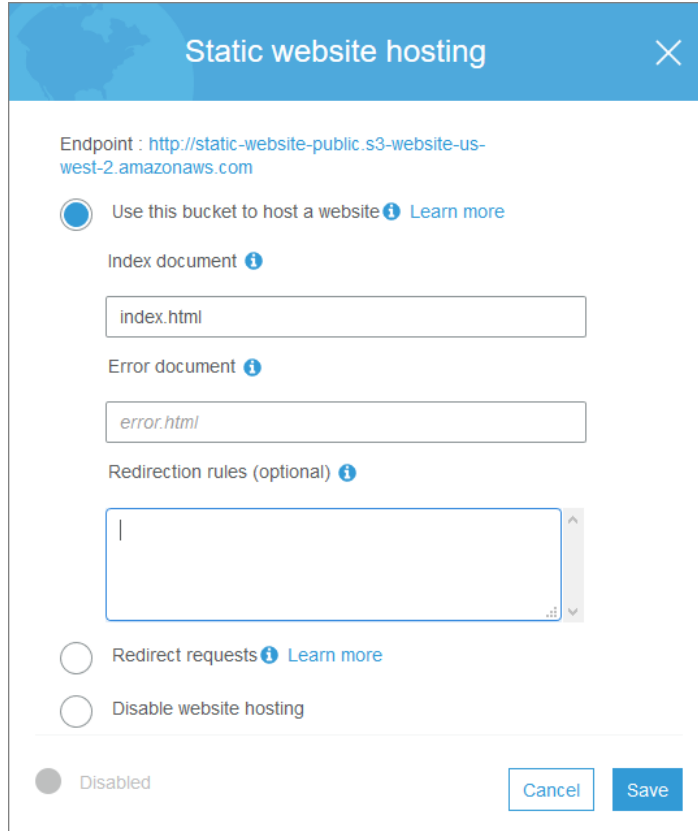

When you configure a bucket for website hosting, you must specify an index document. Amazon S3 returns this index document when requests are made to the root domain or any of the subfolders. For more information, see [Configuring a Bucket for Website Hosting](#) in the *Amazon Simple Storage Service Developer Guide*.

- b. (Optional) For 4XX class errors, you can optionally provide your own custom error document that provides additional guidance for your users.

For **Error Document**, enter the name of the file that contains the custom error document. If an error occurs, Amazon S3 returns an HTML error document. For more information, see [Custom Error Document Support](#) in the *Amazon Simple Storage Service Developer Guide*.

- c. (Optional) If you want to specify advanced redirection rules, in the **Edit redirection rules** text area, use XML to describe the rules.

For example, you can conditionally route requests according to specific object key names or prefixes in the request. For more information, see [Configuring a Bucket for Website Hosting](#) in the *Amazon Simple Storage Service Developer Guide*.

The image shows a 'Static website hosting' configuration dialog box. At the top, it displays the endpoint: `http://static-website-public.s3-website-us-west-2.amazonaws.com`. Below this, there are three radio button options: 'Use this bucket to host a website' (which is selected), 'Redirect requests', and 'Disable website hosting'. The 'Use this bucket to host a website' option has a 'Learn more' link. Under this option, there are two text input fields: 'Index document' with the value 'index.html' and 'Error document' with the value 'error.html'. Below these is a 'Redirection rules (optional)' section with a large text area. At the bottom, there are 'Cancel' and 'Save' buttons. A 'Disabled' label is also present at the bottom left.

7. To disable block public access for the bucket, follow these steps:
 - a. Select the bucket, and choose **Edit public access settings**.

- b. Clear **Block all public access**, and choose **Save**.

Edit block public access settings for selected buckets

Total buckets: 1 (Public: 0)

Block public access (bucket settings)

Public access is granted to buckets and objects through access control lists (ACLs), bucket policies, or both. In order to ensure that public access to buckets and objects is blocked, turn on Block *all* public access. These settings apply only to selected buckets. AWS recommends that you turn on Block *all* public access, but before applying any of these settings, ensure that your applications will work correctly without public access. If you require some level of public access to your buckets or objects within, you can customize the individual settings below to suit your specific storage use cases. [Learn more](#)

The Block public access settings turned on at the account level affect public access to all buckets in the account. To determine which settings are turned on, check your Block public access (account settings).

- ☒ **Block *all* public access**
Turning this setting on is the same as turning on all four settings below. Each of the following settings are independent of one another.
- ☐ **Block public access to buckets and objects granted through *new* access control lists (ACLs)**
S3 will block public access permissions applied to newly added buckets or objects, and prevent the creation of new public access ACLs for existing buckets. This setting doesn't change any existing permissions that allow public access to S3 resources using ACLs.
- ☐ **Block public access to buckets and objects granted through *any* access control lists (ACLs)**
S3 will ignore all ACLs that grant public access to buckets and objects.

- c. To confirm your changes, enter **confirm**, and then choose **Confirm**.

Edit block public access settings for selected buckets

Updating the Amazon S3 block public access settings affects all selected buckets. This may result in some buckets and objects becoming public.

To confirm the settings, type *confirm* in the field.

8. Add a bucket policy to the website bucket that grants everyone access to the objects in the bucket.

When you configure a bucket as a website, you must make the objects that you want to serve publicly readable. To do so, you write a bucket policy that grants everyone `s3:GetObject` permission. The following example bucket policy grants everyone access to the objects in the `example-bucket` bucket.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "PublicReadGetObject",
      "Effect": "Allow",
      "Principal": "*",
      "Action": [
        "s3:GetObject"
      ],
      "Resource": [
        "arn:aws:s3:::example-bucket/*"
      ]
    }
  ]
}
```

For information about adding a bucket policy, see [How Do I Add an S3 Bucket Policy? \(p. 127\)](#) For more information about website permissions, see [Permissions Required for Website Access](#) in the *Amazon Simple Storage Service Developer Guide*.

Note

If you choose **Disable website hosting**, Amazon S3 removes the website configuration from the bucket, so that the bucket is no longer accessible from the website endpoint. However, the bucket is still available at the REST endpoint. For a list of Amazon S3 endpoints, see [Amazon S3 Regions and Endpoints](#) in the *Amazon Web Services General Reference*.

How Do I Redirect Requests to an S3 Bucket Hosted Website to Another Host?

You can redirect all requests to your S3 bucket hosted static website to another host.

To redirect all requests to an S3 bucket's website endpoint to another host

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want to redirect all requests from.

3. Choose **Properties**.

4. Choose **Static website hosting**.

5. Choose **Redirect requests**.

A dialog box titled "Static website hosting" with a close button (X) in the top right corner. The dialog shows the endpoint "admin-created3.s3-website-us-west-2.amazonaws.com". There are three radio button options: "Use this bucket to host", "Redirect requests" (which is selected), and "Disable website hosting". Under "Redirect requests", there is a text input field for "Target Bucket or Domain" containing "Bucketname1 or www.exampledomain.com", and another text input field for "Protocol" containing "https or http". At the bottom right, there are "Cancel" and "Save" buttons.

- a. For **Target bucket or domain**, type the name of the bucket or the domain name where you want requests to be redirected. To redirect requests to another bucket, type the name of the target bucket. For example, if you are redirecting to a root domain address, you would type **www.example.com**. For more information, see [Configure a Bucket for Website Hosting](#) in the *Amazon Simple Storage Service Developer Guide*.
 - b. For **Protocol**, type the protocol (http, https) for the redirected requests. If no protocol is specified, the protocol of the original request is used. If you redirect all requests, any request made to the bucket's website endpoint will be redirected to the specified host name.
6. Choose **Save**.

How Do I Set Up a Destination to Receive Event Notifications?

Before you can enable event notifications for your bucket you must set up one of the following destination types:

An Amazon SNS topic

Amazon Simple Notification Service (Amazon SNS) is a web service that coordinates and manages the delivery or sending of messages to subscribing endpoints or clients. You can use the Amazon SNS console to create an Amazon SNS topic that your notifications can be sent to. The Amazon SNS topic must be in the same region as your Amazon S3 bucket. For information about creating an Amazon SNS topic, see [Getting Started](#) in the *Amazon Simple Notification Service Developer Guide*.

Before you can use the Amazon SNS topic that you create as an event notification destination, you need the following:

- The Amazon Resource Name (ARN) for the Amazon SNS topic
- A valid Amazon SNS topic subscription (the topic subscribers are notified when a message is published to your Amazon SNS topic)
- A permissions policy that you set up in the Amazon SNS console (as shown in the following example)

```
{
  "Version": "2012-10-17",
  "Id": "__example_policy_ID",
  "Statement": [
    {
      "Sid": "example-statement-ID",
      "Effect": "Allow",
      "Principal": "*",
      "Action": "SNS:Publish",
      "Resource": "arn:aws:sns:region:account-number:topic-name",
      "Condition": {
        "ArnEquals": {
          "aws:SourceArn": "arn:aws:s3:::bucket-name"
        }
      }
    }
  ]
}
```

An Amazon SQS queue

You can use the Amazon SQS console to create an Amazon SQS queue that your notifications can be sent to. The Amazon SQS queue must be in the same region as your Amazon S3 bucket. For information about creating an Amazon SQS queue, see [Getting Started with Amazon SQS](#) in the *Amazon Simple Queue Service Developer Guide*.

Before you can use the Amazon SQS queue as an event notification destination, you need the following:

- The Amazon Resource Name (ARN) for the Amazon SQS topic
- A permissions policy that you set up in the Amazon SQS console (as shown in the following example)

```
{
  "Version": "2012-10-17",
  "Id": "__example_policy_ID",
  "Statement": [
```

```
{
  "Sid": "example-statement-ID",
  "Effect": "Allow",
  "Principal": "*",
  "Action": "SQS:*",
  "Resource": "arn:aws:sqs:region:account-number:queue-name",
  "Condition": {
    "ArnEquals": {
      "aws:SourceArn": "arn:aws:s3:::bucket-name"
    }
  }
}
```

A Lambda function

You can use the AWS Lambda console to create a Lambda function. The Lambda function must be in the same region as your S3 bucket. For information about creating a Lambda function, see the [AWS Lambda Developer Guide](#).

Before you can use the Lambda function as an event notification destination, you must have the name or the ARN of a Lambda function to set up the Lambda function as an event notification destination.

For information about using Lambda with Amazon S3, see [Using AWS Lambda: with Amazon S3](#) in the *AWS Lambda Developer Guide*.

How Do I Enable and Configure Event Notifications for an S3 Bucket?

You can enable certain Amazon S3 bucket events to send a notification message to a destination whenever the events occur. This section explains how to use the Amazon S3 console to enable event notifications. For information about using event notifications with the AWS SDKs and the Amazon S3 REST APIs, see [Configuring Notifications for Amazon S3 Events](#) in the *Amazon Simple Storage Service Developer Guide*.

Amazon S3 Event Notification Types and Destinations

When configuring event notifications for a bucket, you must specify the type of events that you want to be notified of and the destination where you want the notifications sent.

Amazon S3 can send notifications for the following types of events:

- **An object created event** – You choose **ObjectCreated (All)** when configuring your events in the console to enable notifications for anytime an object is created in your bucket. Or, you can select one or more of the specific object-creation actions to trigger event notifications. These actions are **Put**, **Post**, **Copy**, and **CompleteMultiPartUpload**.
- **Object delete events** – You select **ObjectDelete (All)** when configuring your events in the console to enable notification for anytime an object is deleted. Or, you can select **Delete** to trigger event

notifications when an unversioned object is deleted or a versioned object is permanently deleted. You select **Delete Marker Created** to trigger event notifications when a delete marker is created for a versioned object.

- **Restore object events** – When configuring events in the console to enable notifications for the restoration of objects stored in the GLACIER storage class. Select **Restore from Glacier initiated** to be notified of when the restore is initiated. Select **Restore from Glacier completed** to be notified when restoration of an object is complete.
- **Reduced Redundancy Storage (RRS) object lost events** – You select **RRSObjectLost** to be notified when Amazon S3 detects that an object of the RRS storage class has been lost.
- **Replication events** – You can choose to receive replication event notifications if you have replication with S3 Replication Time Control (S3 RTC) enabled. For more information, see all the replication events and their descriptions in the [Supported Event Types](#) section in the *Amazon Simple Storage Service Developer Guide*.

Event notification messages can be sent to the following types of destinations:

- **An Amazon Simple Notification Service (Amazon SNS) topic** – A web service that coordinates and manages the delivery or sending of messages to subscribing endpoints or clients.
- **An Amazon Simple Queue Service (Amazon SQS) queue** – Offers reliable and scalable hosted queues for storing messages as they travel between computer.
- **A Lambda function** – AWS Lambda is a compute service where you can upload your code and the service can run the code on your behalf using the AWS infrastructure. You package up and upload your custom code to AWS Lambda when you create a Lambda function.

Enabling and Configuring Event Notifications

Before you can enable event notifications for your bucket, you must set up one of these destination types. For more information, see [How Do I Set Up a Destination to Receive Event Notifications?](#) (p. 27).

To enable and configure event notifications for an S3 bucket

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want to enable events for.

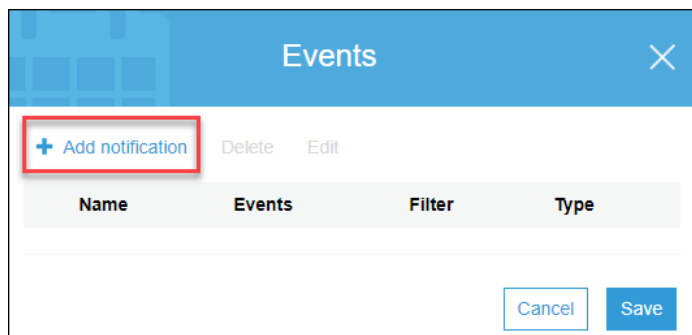

3. Choose **Properties**.

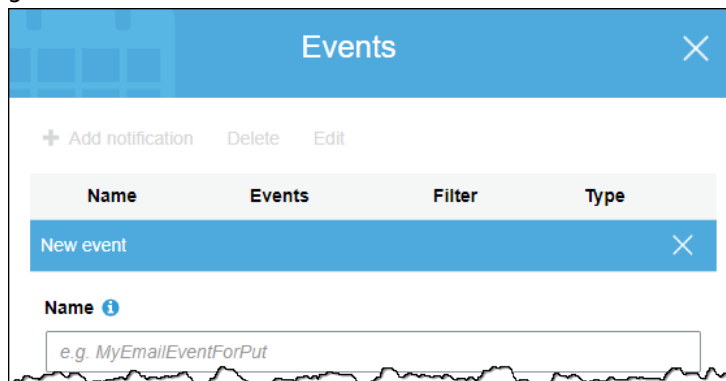

4. Under Advanced settings, choose **Events**.

5. Choose **Add notification**.

6. In **Name**, enter a descriptive name for your event configuration. If you don't enter a name, a GUID is generated and used for the name.

7. Under **Events**, select one or more of the types of event occurrences that you want to receive notifications for. When the event occurs, a notification is sent to a destination that you choose in **Step 9**. For a description of the event types, see [Amazon S3 Event Notification Types and Destinations](#) (p. 28).

<input type="checkbox"/> Delete marker created	

For information about deleting versioned objects, see [Deleting Object Versions](#). For information about object versioning, see [Object Versioning](#) and [Using Versioning](#).

Note

When you delete the last object from a folder, Amazon S3 can generate an object creation event. The Amazon S3 console displays a folder under the following circumstances:

- When a zero-byte object has a trailing slash (/) in its name (in this case there is an actual Amazon S3 object of 0 bytes that represents a folder).
- If the object has a slash (/) within its name (in this case there isn't an actual object representing the folder).

When there are multiple objects with the same prefix with a trailing slash (/) as part of their names, those objects are shown as being part of a folder. The name of the folder is formed from the characters preceding the trailing slash (/). When you delete all the objects listed under that folder, no actual object is available to represent the empty folder. Under such circumstances, the Amazon S3 console creates a zero-byte object to represent that folder. If you enabled event notification for the creation of objects, the zero-byte object creation action that is taken by the console triggers an object creation event.

8. Enter an object name **Prefix** or a **Suffix** to filter the event notifications by the prefix or suffix. For example, you can set up a filter so that you are sent a notification only when files are added to an image folder (for example, objects with the name prefix `images/`). For more information, see [Configuring Notifications with Object Key Name Filtering](#).

Prefix ⓘ

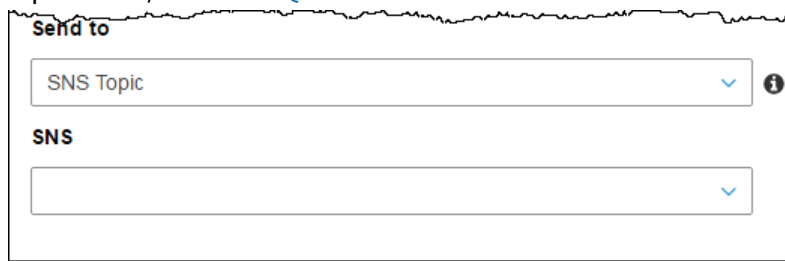

Suffix ⓘ

9. Choose the type of destination to have the event notifications sent to. For a description of the destinations, see [Amazon S3 Event Notification Types and Destinations](#) (p. 28).

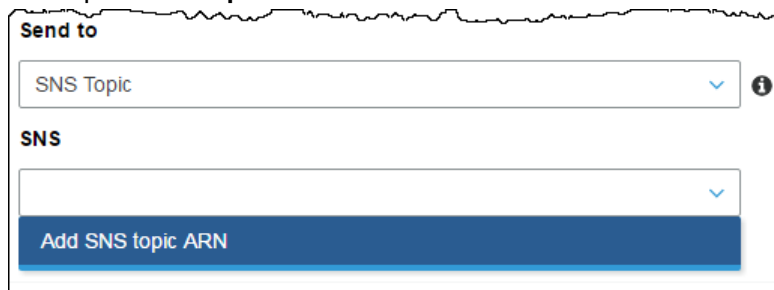

a. If you choose the **SNS Topic** destination type:

- i. In the **SNS topic** box, enter the name of (or choose from the menu) the Amazon SNS topic that will receive notifications from Amazon S3. For information about the Amazon SNS topic format, see [SNS FAQ](#).

- ii. (Optional) You can also select **Add SNS topic ARN** from the menu and enter the **ARN** of the SNS topic in **SNS topic ARN**.

b. If you choose the **SQS queue** destination type, do the following:

- i. In **SQS queue**, enter or choose a name from the menu of the Amazon SQS queue that you want to receive notifications from Amazon S3. For information about Amazon SQS, see [What is Amazon Simple Queue Service?](#) in the *Amazon Simple Queue Service Developer Guide*.
- ii. (Optional) You can also choose **Add SQS topic ARN** from the menu and enter the ARN of the SQS queue in **SQS queue ARN**.

c. If you choose the **Lambda Function** destination type, do the following:

- i. In **Lambda Function**, enter or choose the name of the Lambda function that you want to receive notifications from Amazon S3.
- ii. If you don't have any Lambda functions in the Region that contains your bucket, you are prompted to enter a Lambda function ARN. In **Lambda Function ARN**, enter the ARN of the Lambda function that you want to receive notifications from Amazon S3.

- iii. (Optional) You can also choose **Add Lambda function ARN** from the menu and enter the ARN of the Lambda function in **Lambda function ARN**.

For information about using Lambda with Amazon S3, see [Using AWS Lambda with Amazon S3](#) in the *AWS Lambda Developer Guide*.

10. Choose **Save**. Amazon S3 sends a test message to the event notification destination.

How Do I Enable Transfer Acceleration for an S3 Bucket?

Amazon Simple Storage Service (Amazon S3) transfer acceleration enables fast, easy, and secure transfers of files between your client and an S3 bucket over long distances. This topic describes how to enable Amazon S3 transfer acceleration for a bucket. For more information, see [Amazon S3 Transfer Acceleration](#) in the *Amazon Simple Storage Service Developer Guide*.

To enable transfer acceleration for an S3 bucket

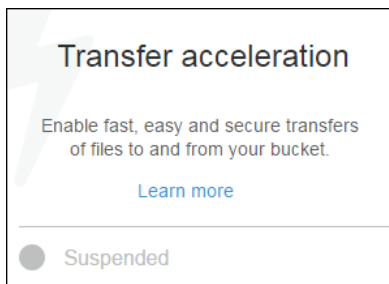

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want to enable transfer acceleration for.

3. Choose **Properties**.

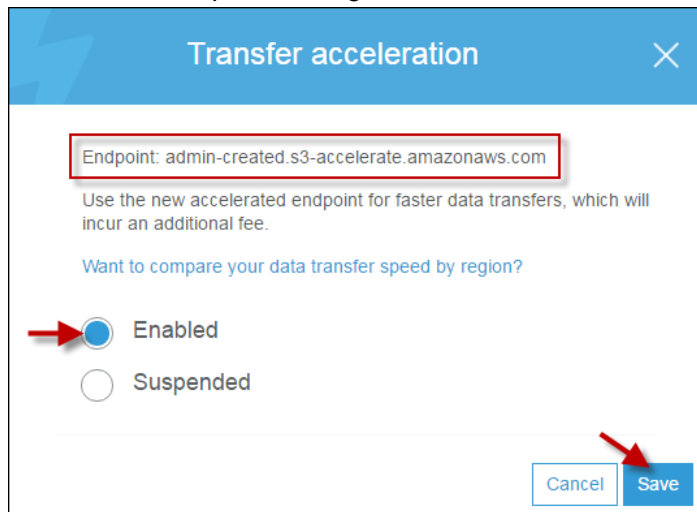

4. Choose **Transfer acceleration**.

5. Choose **Enabled**, and then choose **Save**.

Endpoint displays the endpoint domain name that you use to access accelerated data transfers to and from the bucket that is enabled for transfer acceleration. If you suspend transfer acceleration, the accelerate endpoint no longer works.

6. (Optional) If you want to run the [Amazon S3 Transfer Acceleration Speed Comparison tool](#), which compares accelerated and non-accelerated upload speeds starting with the Region in which the transfer acceleration bucket is enabled, choose the **Want to compare your data transfer speed by region?** option. The Speed Comparison tool uses multipart uploads to transfer a file from your browser to various AWS Regions with and without using Amazon S3 transfer acceleration.

Introduction to Amazon S3 Access Points

You can use Amazon S3 access points to manage access to your S3 objects. Amazon S3 access points are named network endpoints that are attached to buckets that you can use to perform S3 object operations, such as uploading and retrieving objects. A bucket can have up to 1,000 access points attached, and each access point enforces distinct permissions and network controls to give you fine-grained control over access to your S3 objects.

For more information about Amazon S3 Access Points, see [Managing Data Access with Amazon S3 Access Points](#) in the *Amazon Simple Storage Service Developer Guide*.

The following topics explain how to use the S3 Management Console to create, manage, and use Amazon S3 Access Points.

Topics

- [Creating an Amazon S3 Access Point](#) (p. 35)
- [Managing and Using Amazon S3 Access Points](#) (p. 36)

Creating an Amazon S3 Access Point

This section explains how to create an Amazon S3 access point using the AWS Management Console. For information about creating access points using the AWS CLI, AWS SDKs, and the Amazon S3 REST APIs, see [Managing Data Access with Amazon S3 Access Points](#) in the *Amazon Simple Storage Service Developer Guide*.

An access point is associated with exactly one Amazon S3 bucket. Before you begin, make sure that you have created a bucket that you want to use with this access point. For more information about creating buckets, see [Creating and Configuring an S3 Bucket](#) (p. 3).

To create an access point

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **S3 buckets** section, select the bucket that you want to attach this access point to.
3. On the bucket detail page, choose the **Access points** tab.
4. Choose **Create access point**.
5. Enter your desired name for the access point in the **Access point name** field.
6. Choose a **Network access type**. If you choose **Virtual private cloud (VPC)**, enter the **VPC ID** that you want to use with the access point.

For more information about network access type for access points, see [Creating Access Points Restricted to a Virtual Private Cloud](#) in the *Amazon Simple Storage Service Developer Guide*.

7. Select the block public access settings that you want to apply to the access point. All block public access settings are enabled by default for new access points, and we recommend that you leave all settings enabled unless you know you have a specific need to disable any of them. Amazon S3

currently doesn't support changing an access point's block public access settings after the access point has been created.

For more information about using Amazon S3 Block Public Access with access points, see [Managing Public Access to Access Points](#) in the *Amazon Simple Storage Service Developer Guide*.

8. (Optional) Specify the access point policy. The console automatically displays the Amazon Resource Name (ARN) for the access point, which you can use in the policy.
9. Choose **Create access point**.

Managing and Using Amazon S3 Access Points

This section explains how to manage and use your Amazon S3 access points using the AWS Management Console. Each access point is associated with a single Amazon S3 bucket. Before you begin, navigate to the list of your access points for a bucket as described in the following procedure.

To find a list of access points for a bucket

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **S3 buckets** section, select the bucket whose access points you want to manage.
3. On the bucket detail page, choose the **Access points** tab.

From the **Access points** tab, you can view an access point's configuration details, edit an access point's policy, use an access point to access your bucket, or delete an access point. The following procedures explain how to perform each of these tasks.

To view access point configuration details

1. Navigate to the **Access points** tab for your bucket.
2. Locate the access point whose configuration you want to view. You can browse for the access point in the access point list, or you can search for a specific access point using the **Search by name** field.
3. Choose the name of the access point whose configuration you want to view.

Note

To view an access point's configuration, choose (click on) the name of the access point, not the option button next to the access point name.

To edit an access point policy

1. Navigate to the **Access points** tab for your bucket.
2. Select the option button next to the name of the access point whose policy you want to edit.
3. Choose **Edit access point policy**.
4. Enter the policy in the text field. The console automatically displays the Amazon Resource Name (ARN) for the access point, which you can use in the policy. You can also choose **Policy generator** to use the AWS Policy Generator to help construct the policy.
5. Choose **Save**.

To use an access point to access your bucket

1. Navigate to the **Access points** tab for your bucket.
2. Select the option button next to the name of the access point you want to use.

3. Choose **Use this access point**.
4. The console displays a label above the name of your bucket that shows the access point that you're currently using. While you're using the access point, you can only perform the object operations that are allowed by the access point permissions.

Note

The console view always shows all objects in the bucket. Using an access point as described in this procedure restricts the operations you can perform on those objects, but not whether you can see that they exist in the bucket.

5. To exit the access point view of your bucket, choose **Exit access point**.

Note

The S3 Management Console doesn't support using virtual private cloud (VPC) access points to access bucket resources. To access bucket resources from a VPC access point, use the AWS CLI, AWS SDKs, or Amazon S3 REST APIs.

To delete an access point

1. Navigate to the **Access points** tab for your bucket.
2. Select the option button next to the name of the access point that you want to delete.
3. Choose **Delete**.
4. Confirm that you want to delete your access point by entering its name in the text field that appears, and choose **Confirm**.

Uploading, Downloading, and Managing Objects

To upload your data (photos, videos, documents etc.) to Amazon S3, you must first create an S3 bucket in one of the AWS Regions. You can then upload an unlimited number of data objects to the bucket.

The data that you store in Amazon S3 consists of objects. Every object resides within a bucket that you create in a specific AWS Region. Every object that you store in Amazon S3 resides in a bucket.

Objects stored in a region never leave the region unless you explicitly transfer them to another region. For example, objects stored in the EU (Ireland) region never leave it. The objects stored in an AWS region physically remain in that region. Amazon S3 does not keep copies of objects or move them to any other region. However, you can access the objects from anywhere, as long as you have necessary permissions to do so.

Before you can upload an object into Amazon S3, you must have write permissions to a bucket.

Objects can be any file type: images, backups, data, movies, etc. You can have an unlimited number of objects in a bucket. The maximum size of file you can upload by using the Amazon S3 console is 160 GB. To upload a file larger than 160 GB, use the AWS CLI, AWS SDK, or Amazon S3 REST API. For more information, see [Uploading Objects](#) in the *Amazon Simple Storage Service Developer Guide*.

How Do I Upload Files and Folders to an S3 Bucket?

This topic explains how to use the AWS Management Console to upload one or more files or entire folders to an Amazon S3 bucket. Before you can upload files and folders to an Amazon S3 bucket, you need write permissions for the bucket. For more information about access permissions, see [Setting Bucket and Object Access Permissions](#) (p. 116). For information about uploading files programmatically, see [Uploading Objects](#) in the *Amazon Simple Storage Service Developer Guide*.

When you upload a file to Amazon S3, it is stored as an S3 object. Objects consist of the file data and metadata that describes the object. You can have an unlimited number of objects in a bucket.

You can upload any file type—images, backups, data, movies, etc.—into an S3 bucket. The maximum size of a file that you can upload by using the Amazon S3 console is 160 GB. To upload a file larger than 160 GB, use the AWS CLI, AWS SDK, or Amazon S3 REST API. For more information, see [Uploading Objects](#) in the *Amazon Simple Storage Service Developer Guide*.

You can upload files by dragging and dropping or by pointing and clicking. To upload folders, you *must* drag and drop them. Drag and drop functionality is supported *only* for the Chrome and Firefox browsers. For information about which Chrome and Firefox browser versions are supported, see [Which Browsers are Supported for Use with the AWS Management Console?](#)

When you upload a folder, Amazon S3 uploads all of the files and subfolders from the specified folder to your bucket. It then assigns an object key name that is a combination of the uploaded file name and the folder name. For example, if you upload a folder called `/images` that contains two files, `sample1.jpg` and `sample2.jpg`, Amazon S3 uploads the files and then assigns the corresponding key names, `images/sample1.jpg` and `images/sample2.jpg`. The key names include the folder name as a prefix. The Amazon S3 console displays only the part of the key name that follows the last `/`. For example, within an `images` folder the `images/sample1.jpg` and `images/sample2.jpg` objects are displayed as `sample1.jpg` and a `sample2.jpg`.

If you upload individual files and you have a folder open in the Amazon S3 console, when Amazon S3 uploads the files, it includes the name of the open folder as the prefix of the key names. For example, if you have a folder named `backup` open in the Amazon S3 console and you upload a file named `sample1.jpg`, the key name is `backup/sample1.jpg`. However, the object is displayed in the console as `sample1.jpg` in the `backup` folder.

If you upload individual files and you do not have a folder open in the Amazon S3 console, when Amazon S3 uploads the files, it assigns only the file name as the key name. For example, if you upload a file named `sample1.jpg`, the key name is `sample1.jpg`. For more information on key names, see [Object Key and Metadata](#) in the *Amazon Simple Storage Service Developer Guide*.

If you upload an object with a key name that already exists in a versioning-enabled bucket, Amazon S3 creates another version of the object instead of replacing the existing object. For more information about versioning, see [How Do I Enable or Suspend Versioning for an S3 Bucket?](#) (p. 12).

Uploading Files and Folders by Using Drag and Drop

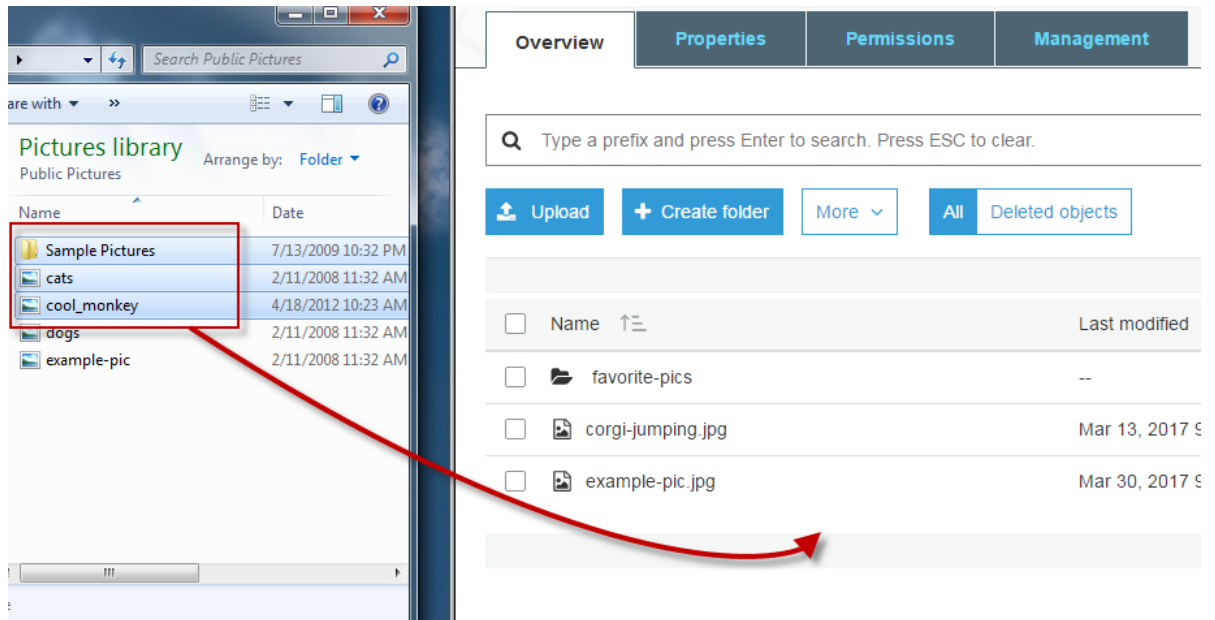

If you are using the Chrome or Firefox browsers, you can choose the folders and files to upload, and then drag and drop them into the destination bucket. Dragging and dropping is the *only* way that you can upload folders.

To upload folders and files to an S3 bucket by using drag and drop

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want to upload your folders or files to.

3. In a window other than the console window, select the files and folders that you want to upload. Then drag and drop your selections into the console window that lists the objects in the destination bucket.

The files you chose are listed in the **Upload** dialog box.

4. In the **Upload** dialog box, do one of the following:
 - a. Drag and drop more files and folders to the console window that displays the **Upload** dialog box. To add more files, you can also choose **Add more files**. This option works *only* for files, not folders.
 - b. To immediately upload the listed files and folders without granting or removing permissions for specific users or setting public permissions for all of the files that you're uploading, choose **Upload**. For information about object access permissions, see [How Do I Set Permissions on an Object? \(p. 121\)](#).
 - c. To set permissions or properties for the files that you are uploading, choose **Next**.

5. On the **Set Permissions** page, under **Manage users** you can change the permissions for the AWS account owner. The *owner* refers to the AWS account root user, and not an AWS Identity and Access Management (IAM) user. For more information about the root user, see [The AWS Account Root User](#).

Choose **Add account** to grant access to another AWS account. For more information about granting permissions to another AWS account, see [How Do I Set ACL Bucket Permissions?](#) (p. 124).

Under **Manage public permissions** you can grant read access to your objects to the general public (everyone in the world), for all of the files that you're uploading. Granting public read access is applicable to a small subset of use cases such as when buckets are used for websites. We recommend that you do not change the default setting of **Do not grant public read access to this object(s)**. You can always make changes to object permissions after you upload the object. For information about object access permissions, see [How Do I Set Permissions on an Object?](#) (p. 121).

When you're done configuring permissions, choose **Next**.

The screenshot shows the 'Upload' console window with the 'Set permissions' step selected. At the top, a progress bar shows four steps: 1. Select files (checked), 2. Set permissions (active), 3. Set properties, and 4. Review. Below the progress bar, a summary bar indicates '1 Files', 'Size: 1.3 MB', and 'Target path: admin-created'. The main section is titled 'Manage users' and contains a table with columns: User ID, Objects, and Object permissions. The first row shows 'johndoe(Owner)' with 'Read' and 'Write' permissions checked for both 'Objects' and 'Object permissions'. Below this is a section for 'Access for other AWS account' with an 'Add account' button. Another table with columns 'Account', 'Objects', and 'Object permissions' is shown below. The 'Manage public permissions' section has a dropdown menu set to 'Do not grant public read access to this object(s) (Recommended)'. At the bottom are 'Upload', 'Previous', and 'Next' buttons.

6. On the **Set Properties** page, choose the storage class and encryption method to use for the files that you are uploading. You can also add or modify metadata.
 - a. Choose a storage class for the files you're uploading. For more information about storage classes, see [Storage Classes](#) in the *Amazon Simple Storage Service Developer Guide*.

The screenshot shows the 'Upload' console window with the 'Set properties' step selected. The progress bar shows: 1. Select files (checked), 2. Set permissions (checked), 3. Set properties (active), and 4. Review. The main section is titled 'Storage class' with a subtitle 'Choose a storage class based on your use case and access requirements. [Learn more](#) or see [Amazon S3 pricing](#)'. Below this is a table with the following data:

Storage class	Designed for	Availability Zones	Min storage duration	Min billable object size	Monitoring and automation fees	Retrieval fees
<input type="radio"/> Standard	Frequently accessed data	≥ 3	-	-	-	-
<input checked="" type="radio"/> Intelligent-Tiering	Long-lived data with changing or unknown access patterns	≥ 3	30 days	-	Per-object fees apply	-
<input checked="" type="radio"/> Standard-IA	Long-lived, infrequently accessed data	≥ 3	30 days	128KB	-	Per-GB fees apply
<input checked="" type="radio"/> One Zone-IA	Long-lived, infrequently accessed, non-critical data	≥ 1	30 days	128KB	-	Per-GB fees apply
<input checked="" type="radio"/> Glacier	Archive data with retrieval times ranging from minutes to hours	≥ 3	90 days	-	-	Per-GB fees apply
<input checked="" type="radio"/> Glacier Deep Archive	Archive data that rarely, if ever, needs to be accessed	≥ 3	180 days	-	-	Per-GB fees apply

At the bottom are 'Upload', 'Previous', and 'Next' buttons.

- b. Choose the type of encryption for the files that you're uploading. If you don't want to encrypt them, choose **None**.
 - i. To encrypt the uploaded files using keys that are managed by Amazon S3, choose **Amazon S3 master-key**. For more information, see [Protecting Data with Amazon S3-Managed Encryption Keys Classes](#) in the *Amazon Simple Storage Service Developer Guide*.

- ii. To encrypt the uploaded files using the AWS Key Management Service (AWS KMS), choose **AWS KMS master-key**. Then choose a customer master key (CMK) from the list of AWS KMS CMKs.

Note

To encrypt objects in a bucket, you can use only CMKs that are available in the same AWS Region as the bucket.

You can give an external account the ability to use an object that is protected by an AWS KMS CMK. To do this, select **Custom KMS ARN** from the list and enter the Amazon Resource Name (ARN) for the external account. Administrators of an external account that have usage permissions to an object protected by your AWS KMS CMK can further restrict access by creating a resource-level IAM policy.

For more information about creating an AWS KMS CMK, see [Creating Keys](#) in the *AWS Key Management Service Developer Guide*. For more information about protecting data with AWS KMS, see [Protecting Data Using Keys Stored in AWS KMS \(SSE-KMS\)](#) in the *Amazon Simple Storage Service Developer Guide*.

- c. Metadata for Amazon S3 objects is represented by a name-value (key-value) pair. There are two kinds of metadata: system-defined metadata and user-defined metadata.

If you want to add Amazon S3 system-defined metadata to all of the objects you are uploading, for **Header**, select a header. You can select common HTTP headers, such as **Content-Type** and **Content-Disposition**. Type a value for the header, and then choose **Save**. For a list of system-defined metadata and information about whether you can add the value, see [System-Defined Metadata](#) in the *Amazon Simple Storage Service Developer Guide*.

- d. Any metadata starting with prefix `x-amz-meta-` is treated as user-defined metadata. User-defined metadata is stored with the object, and is returned when you download the object.

To add user-defined metadata to all of the objects that you are uploading, type `x-amz-meta-` plus a custom metadata name in the **Header** field. Type a value for the header, and then choose **Save**. Both the keys and their values must conform to US-ASCII standards. User-defined metadata can be as large as 2 KB. For more information about user-defined metadata, see [User-Defined Metadata](#) in the *Amazon Simple Storage Service Developer Guide*.

Metadata

Metadata is a set of name-value pairs. You cannot modify object metadata after it is uploaded.

Header	Value	
x-amz-meta-my-data-1	myUserDefinedMetada	<button>Save</button> <button>Clear</button>

Tag

- e. Object tagging gives you a way to categorize storage. Each tag is a key-value pair. Key and tag values are case sensitive. You can have up to 10 tags per object.

To add tags to all of the objects that you are uploading, type a tag name in the **Key** field. Type a value for the tag, and then choose **Save**. A tag key can be up to 128 Unicode characters in length and tag values can be up to 255 Unicode characters in length. For more information about object tags, see [Object Tagging](#) in the *Amazon Simple Storage Service Developer Guide*.

Data transfer fees apply when you download objects. For information about Amazon S3 features, and pricing, see [Amazon S3](#).

Important

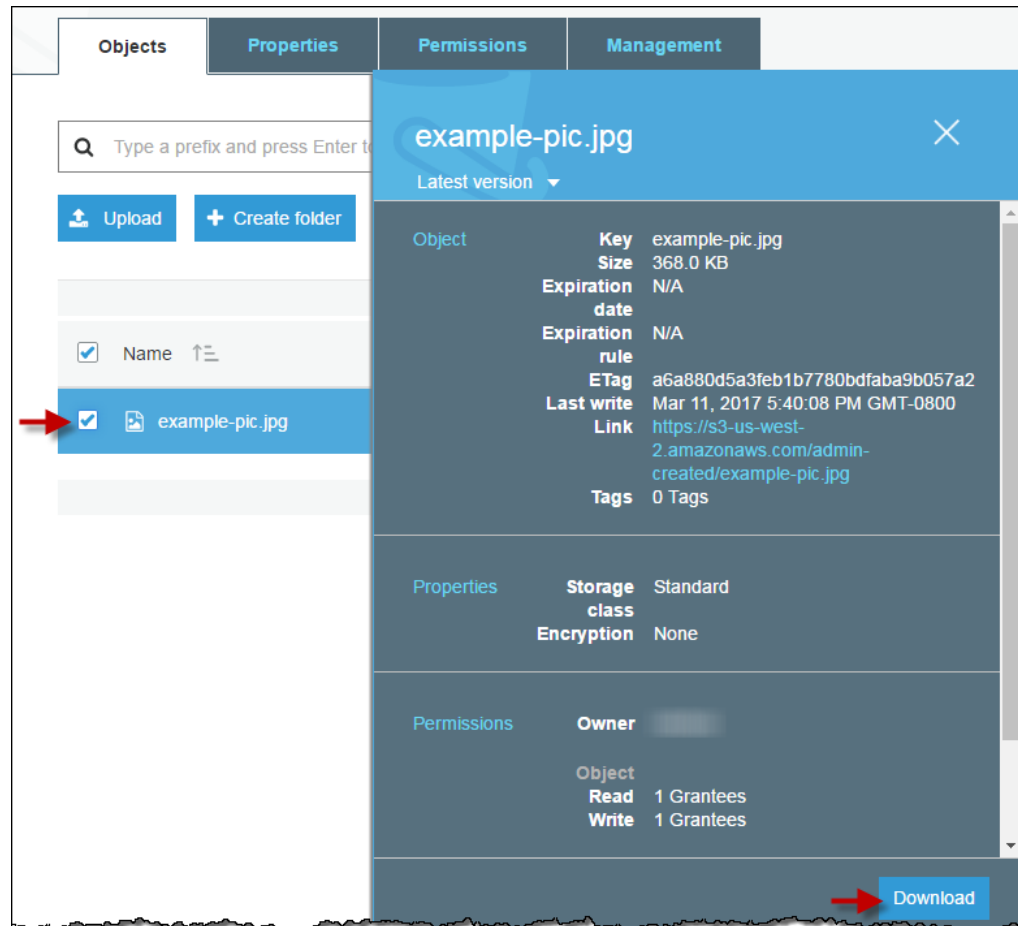

If an object key name consists of a single period (.), or two periods (..), you can't download the object using the Amazon S3 console. To download an object with a key name of "." or "..", you must use the AWS CLI, AWS SDKs, or REST API. For more information about naming objects, see [Object Key Naming Guidelines](#) in the *Amazon Simple Storage Service Developer Guide*.

To download an object from an S3 bucket

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want to download an object from.

3. You can download an object from an S3 bucket in any of the following ways:
 - In the **Name** list, select the check box next to the object you want to download, and then choose **Download** on the object description page that appears.

- Choose the name of the object that you want to download.

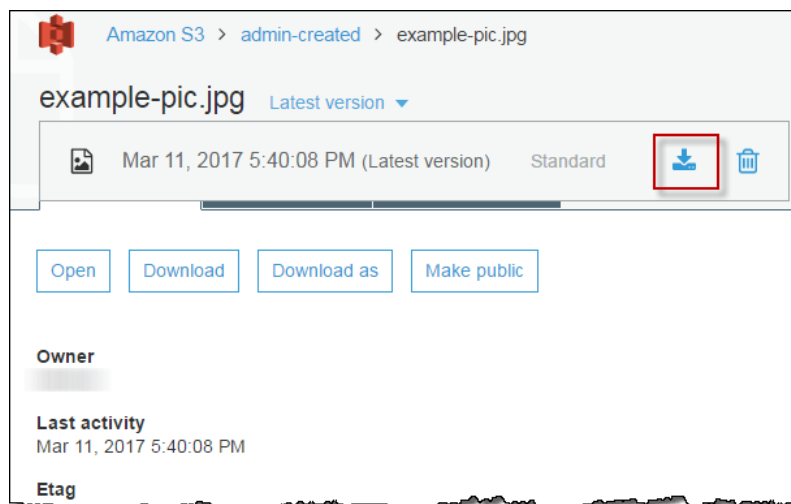

On the **Overview** page, choose **Download**.

- Choose the name of the object that you want to download and then choose **Download as** on the **Overview** page.

- Choose the name of the object that you want to download. Choose **Latest version** and then choose the download icon.

How Do I Delete Objects from an S3 Bucket?

This section explains how to use the Amazon S3 console to delete objects. Because all objects in your S3 bucket incur storage costs, you should delete objects that you no longer need. If you are collecting log files, for example, it's a good idea to delete them when they're no longer needed. You can set up a lifecycle rule to automatically delete objects such as log files.

For information about Amazon S3 features and pricing, see [Amazon S3](#).

To delete objects from an S3 bucket

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want to delete an object from.
3. You can delete objects from an S3 bucket in any of the following ways:
 - In the **Name** list, select the check box next to the objects and folders that you want to delete, choose **Actions**, and then choose **Delete** from the drop-down menu.

In the **Delete objects** dialog box, verify that the name(s) of the object(s) and/or folder(s) you selected for deletion are listed and then choose **Delete**.

- Or, choose the name of the object that you want to delete, choose **Latest version**, and then choose the **trash can** icon.

How Do I Undelete a Deleted S3 Object?

This section explains how to use the Amazon S3 console to recover (undelete) deleted objects.

To be able to undelete a deleted object, you must have had versioning enabled on the bucket that contains the object before the object was deleted. For information about enabling versioning, see [How Do I Enable or Suspend Versioning for an S3 Bucket? \(p. 12\)](#).

When you delete an object in a versioning-enabled bucket, all versions remain in the bucket and Amazon S3 creates a delete marker for the object. To undelete the object, you must delete this delete marker. For more information about versioning and delete markers, see [Object Versioning](#) in the *Amazon Simple Storage Service Developer Guide*.

To recover deleted objects from an S3 bucket

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want.
3. To see a list of the **versions** of the objects in the bucket, select **Show**. You'll be able to see the delete markers for deleted objects.
4. To undelete an object, you must delete the delete marker. Select the check box next to the **delete marker** of the object to recover, and then choose **delete** from the **Actions** menu.
5. Then, choose **Hide** and you'll see the undeleted object listed.

How Do I Restore an S3 Object That Has Been Archived?

This section explains how to use the Amazon S3 console to restore an object that has been archived to the GLACIER or DEEP_ARCHIVE storage classes. Objects stored in the GLACIER or DEEP_ARCHIVE are not immediately accessible. To access an object in this class, you must restore a temporary copy of it to its S3 bucket for the duration (number of days) that you specify. For information about the GLACIER or DEEP_ARCHIVE storage classes, see [Storage Classes](#) in the *Amazon Simple Storage Service Developer Guide*.

When you restore an archive, you pay for both the archive and the restored copy. Because there is a storage cost for the copy, restore objects only for the duration you need them. If you want a permanent copy of the object, create a copy of it in your S3 bucket. For information about Amazon S3 features and pricing, see [Amazon S3](#).

After restoring an object, you can download it from the **Overview** page. For more information, see [How Do I See an Overview of an Object? \(p. 59\)](#).

Archive Retrieval Options

The following are the available retrieval options when restoring an archived object:

- **Expedited** - Expedited retrievals allow you to quickly access your data stored in the GLACIER storage class when occasional urgent requests for a subset of archives are required. For all but the largest archived objects (250 MB+), data accessed using Expedited retrievals is typically made available within 1–5 minutes. Provisioned capacity ensures that retrieval capacity for Expedited retrievals is available when you need it. For more information, see [Provisioned Capacity](#). Expedited retrievals and provisioned capacity are not available for objects stored in the DEEP_ARCHIVE storage class.
- **Standard** - Standard retrievals allow you to access any of your archived objects within several hours. This is the default option for the GLACIER and DEEP_ARCHIVE retrieval requests that do not specify the retrieval option. Standard retrievals typically finish within 3–5 hours for objects stored in the GLACIER storage class. They typically finish within 12 hours for objects stored in the DEEP_ARCHIVE storage class.
- **Bulk** - Bulk retrievals are the lowest-cost retrieval option in Amazon S3 Glacier, enabling you to retrieve large amounts, even petabytes, of data inexpensively. Bulk retrievals typically finish within 5–12 hours for objects stored in the GLACIER storage class. They typically finish within 48 hours for objects stored in the DEEP_ARCHIVE storage class.

For more information about retrieval options, see [Restoring Archived Objects](#) in the *Amazon Simple Storage Service Developer Guide*.

2. Choose the tier that you want to upgrade to and then choose **Restore**. For more information about upgrading to a faster restore tier, see [Restoring Archived Objects](#) in the *Amazon Simple Storage Service Developer Guide*.

Checking Archive Restore Status and Expiration Date

To check the progress of the restoration, see the object overview panel. For information about the overview panel, see [How Do I See an Overview of an Object?](#) (p. 59).

The **Overview** section shows that restoration is **In progress**.

When the temporary copy of the object is available, the object's **Overview** section shows the **Restoration expiry date**. This is when Amazon S3 will remove the restored copy of your archive.

Restored objects are stored only for the number of days that you specify. If you want a permanent copy of the object, create a copy of it in your Amazon S3 bucket.

Amazon S3 calculates the expiry date by adding the number of days that you specify to the time you request to restore the object, and then rounding to the next day at midnight UTC. This calculation applies to the initial restoration of the object and to any extensions to availability that you request. For example, if an object was restored on 10/15/2012 10:30 AM UTC and the number of days that you specified is 3, then the object is available until 10/19/2012 00:00 UTC. If, on 10/16/2012 11:00 AM UTC you change the number of days that you want it to be accessible to 1, then Amazon S3 makes the restored object available until 10/18/2012 00:00 UTC.

After restoring an object, you can download it from the **Overview** page. For more information, see [How Do I See an Overview of an Object?](#) (p. 59).

How Do I Lock an Amazon S3 Object?

With Amazon S3 object lock, you can store objects in Amazon S3 using a *write-once-read-many* (WORM) model. You can use Amazon S3 object lock to prevent an object from being deleted or overwritten for a fixed amount of time or indefinitely. For information about object locking using the AWS CLI, AWS SDKs, and the Amazon S3 REST APIs, see [Locking Objects Using Amazon S3 Object Lock](#) in the *Amazon Simple Storage Service Developer Guide*.

Before you lock any objects, you have to enable a bucket to use Amazon S3 object lock. You enable object lock when you create a bucket. After you enable Amazon S3 object lock on a bucket, you can lock objects in that bucket. When you create a bucket with object lock enabled, you can't disable object lock or suspend versioning for that bucket.

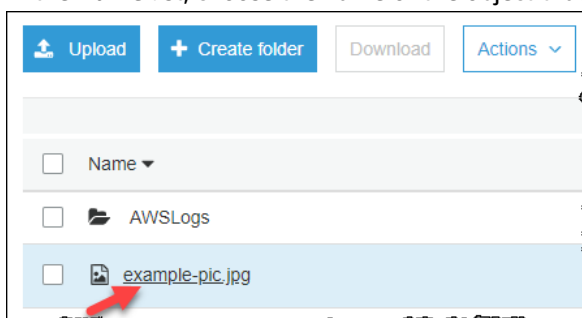

For information about creating a bucket with Amazon S3 object lock enabled, see [How Do I Create an S3 Bucket?](#) (p. 3).

To lock an Amazon S3 object

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.

5. If versioning is enabled on the bucket, choose **Latest versions** to list the versions of the object. You can then choose the download icon to download an object version, or choose the trash can icon to delete an object version.

Important

You can undelete an object only if it was deleted as the latest (current) version. You can't undelete a previous version of an object that was deleted. For more information, see [Object Versioning](#) and [Using Versioning](#) in the *Amazon Simple Storage Service Developer Guide*.

How Do I See the Versions of an S3 Object?

This section explains how to use the Amazon S3 console to see the different versions of an object.

A versioning-enabled bucket can have many versions of the same object; one current (latest) version and zero or more noncurrent (previous) versions. Amazon S3 assigns each object a unique version ID. For information about enabling versioning, see [How Do I Enable or Suspend Versioning for an S3 Bucket?](#) (p. 12).

If a bucket is versioning-enabled, Amazon S3 creates another version of an object under the following conditions:

- If you upload an object that has the same name as an object that already exists in the bucket, Amazon S3 creates another version of the object instead of replacing the existing object.
- If you update any object properties after you upload the object to the bucket, such as changing the storage details or other metadata, Amazon S3 creates a new object version in the bucket.

For more information about versioning support in Amazon S3, see [Object Versioning](#) and [Using Versioning](#) in the *Amazon Simple Storage Service Developer Guide*.

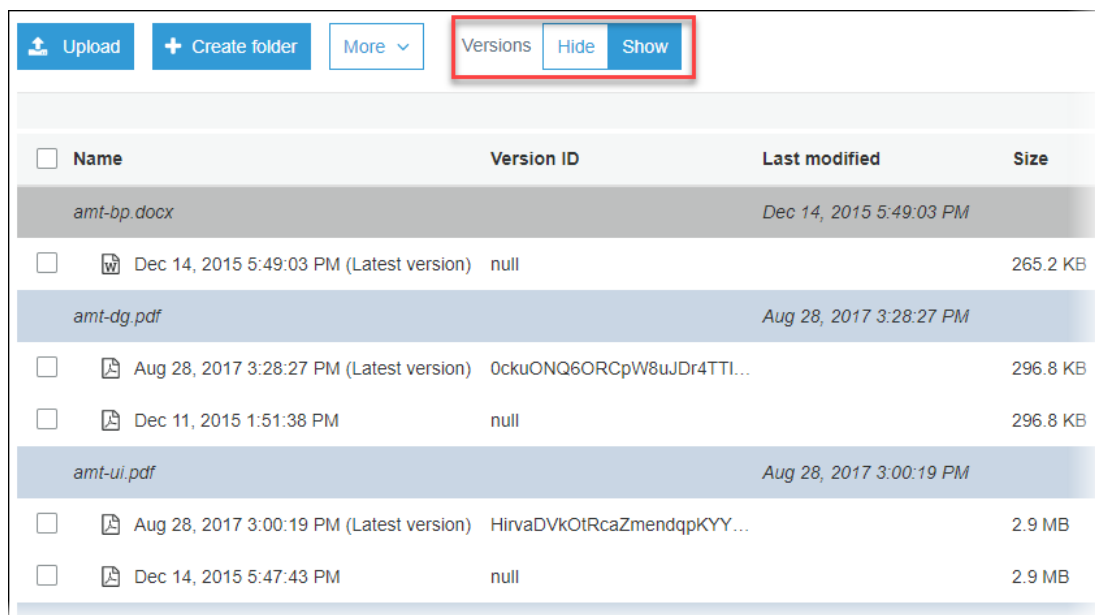

To see multiple versions of an object

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that contains the object.

3. To see a list of the versions of the objects in the bucket, choose **Show**. For each object version, the console shows a unique version ID, the date and time the object version was created, and other properties. (Objects stored in your bucket before you set the versioning state have a version ID of **null**.)

To list the objects without the versions, choose **Hide**.

How Do I View the Properties of an Object?

This section explains how to use the console to view the properties of an object.

To view the properties of an object

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that contains the object.

3. In the **Name** list, choose the name of the object you want to view the properties for.

4. Choose **Properties**.

5. On the **Properties** page, you can configure the following properties for the object.

- a. **Storage class** – Each object in Amazon S3 has a storage class associated with it. The storage class that you choose to use depends on how frequently you access the object. The default storage class for S3 objects is STANDARD. You choose which storage class to use when you upload an object. For more information about storage classes, see [Storage Classes](#) in the *Amazon Simple Storage Service Developer Guide*.

To change the storage class after you upload an object, choose **Storage class**. Choose the storage class that you want, and then choose **Save**.

- b. **Encryption** – You can encrypt your S3 objects. For more information, see [How Do I Add Encryption to an S3 Object?](#) (p. 65).
- c. **Metadata** – Each object in Amazon S3 has a set of name-value pairs that represents its metadata. For information on adding metadata to an S3 object, see [How Do I Add Metadata to an S3 Object?](#) (p. 67).

- d. **Tags** – You can add tags to an S3 object. For more information, see [How Do I Add Tags to an S3 Object?](#) (p. 72).

How Do I Add Encryption to an S3 Object?

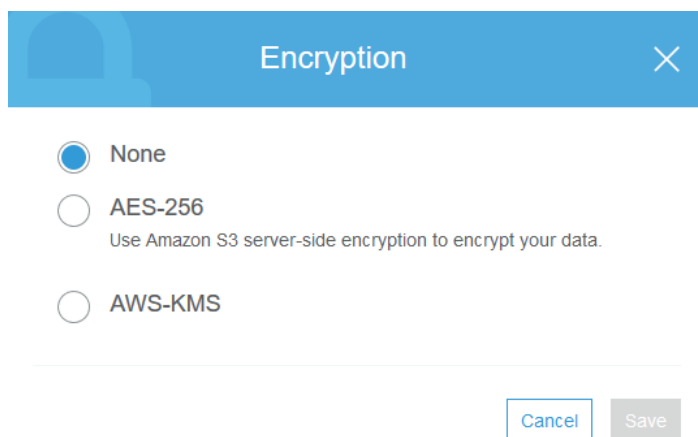

This topic describes how to set or change the type of encryption an object is using.

To add or change encryption for an object

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that contains the object.
3. In the **Name** list, choose the name of the object that you want to add or change encryption for.
4. Choose **Properties**, and then choose **Encryption**.

The **Encryption** dialog opens, giving you three choices for object encryption:

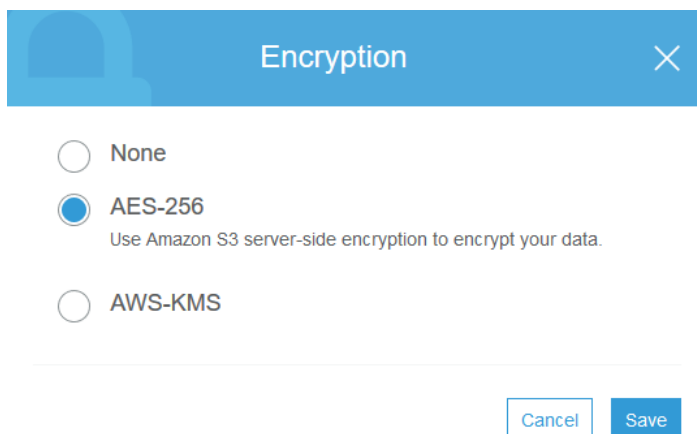

- **None** - No object encryption.
 - **AES-256** - Server-side encryption with Amazon S3-managed keys (SSE-S3).
 - **AWS-KMS** - Server-side encryption with AWS Key Management Service (AWS KMS) customer master keys (SSE-KMS).
5. If you want to remove encryption from an object that already has encryption settings, choose **None** and **Save**.

6. If you want to encrypt your object using keys that are managed by Amazon S3, follow these steps:
- a. Choose **AES-256**.

For more information about using Amazon S3 server-side encryption to encrypt your data, see [Protecting Data with Amazon S3-Managed Encryption Keys Classes](#) in the *Amazon Simple Storage Service Developer Guide*.

- b. Choose **Save**.

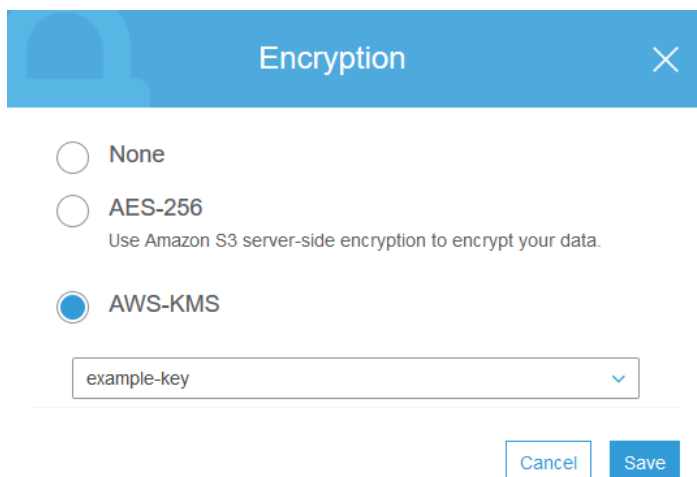

7. If you want to encrypt your object using AWS KMS, follow these steps:

- a. Choose **AWS-KMS**.
- b. Choose an AWS KMS CMK.

The list shows [Customer managed CMKs](#) that you have created and your AWS managed CMK for Amazon S3. For more information about creating a customer managed AWS KMS CMK, see [Creating Keys](#) in the *AWS Key Management Service Developer Guide*.

- c. Choose **Save**.

Important

To encrypt objects in the bucket, you can use only CMKs that are enabled in the same AWS Region as the bucket. Amazon S3 only supports symmetric CMKs. Amazon S3 does not support asymmetric CMKs. For more information, see [Using Symmetric and Asymmetric Keys](#).

8. To give an external account the ability to use an object that is protected by an AWS KMS CMK, follow these steps:
 - a. Choose **AWS-KMS**.
 - b. Type the Amazon Resource Name (ARN) for the external account.
 - c. Choose **Save**.

Administrators of an external account that have usage permissions to an object protected by your AWS KMS CMK can further restrict access by creating a resource-level AWS Identity and Access Management (IAM) policy.

How Do I Add Metadata to an S3 Object?

Each object in Amazon Simple Storage Service (Amazon S3) has a set of name-value pairs that provides metadata about the object. *Metadata* is additional information about the object. Some metadata is set by Amazon S3 when you upload the object, for example, `Date` and `Content-Length`. You can also set some metadata when you upload the object, or you can add it later. This section explains how to use the Amazon S3 console to add metadata to an S3 object.

Object metadata is a set of name-value (key-value) pairs. For example, the metadata for content length, `Content-Length`, is the name (key) and the size of the object in bytes (value). For more information about object metadata, see [Object Metadata](#) in the *Amazon Simple Storage Service Developer Guide*.

There are two kinds of metadata for an S3 object, Amazon S3 system metadata and user-defined metadata:

- **System metadata**—There are two categories of system metadata. Metadata such as the `Last-Modified` date is controlled by the system. Only Amazon S3 can modify the value. There is also system metadata that you control, for example, the storage class configured for the object.
- **User-defined metadata**—You can define your own custom metadata, called user-defined metadata. You can assign user-defined metadata to an object when you upload the object or after the object has been uploaded. User-defined metadata is stored with the object and is returned when you download the object. Amazon S3 does not process user-defined metadata.

The following topics describe how to add metadata to an object.

Topics

- [Adding System-Defined Metadata to an S3 Object \(p. 68\)](#)
- [Adding User-Defined Metadata to an S3 Object \(p. 70\)](#)

Adding System-Defined Metadata to an S3 Object

You can configure some system metadata for an S3 object. For a list of system-defined metadata and whether you can modify their values, see [System-Defined Metadata](#) in the *Amazon Simple Storage Service Developer Guide*.

To add system metadata to an object

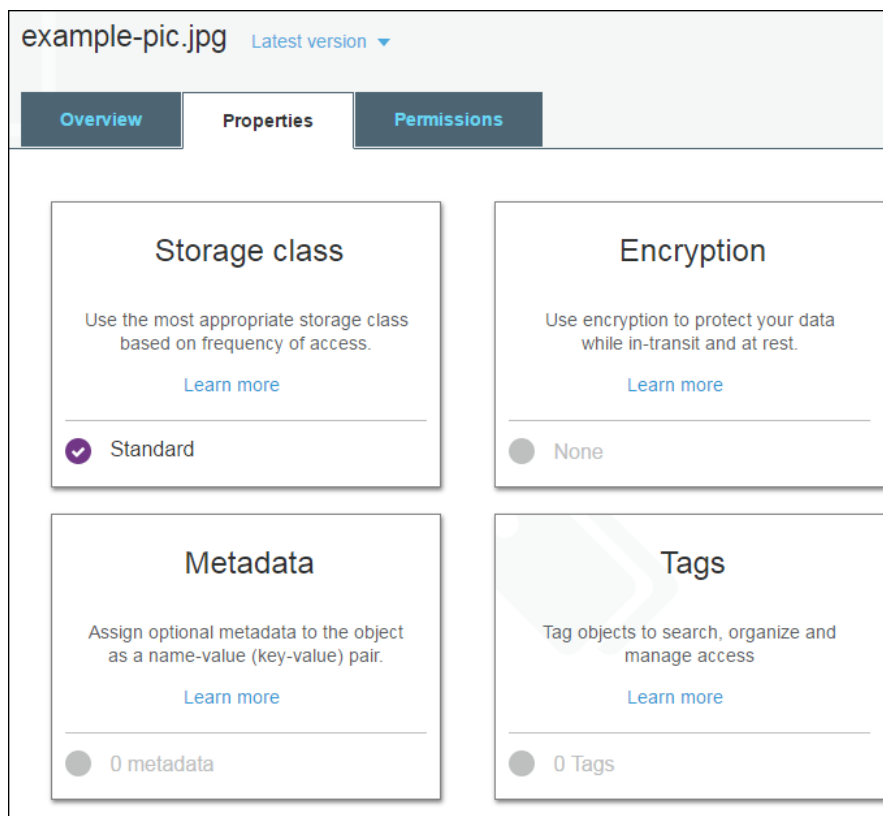

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that contains the object.

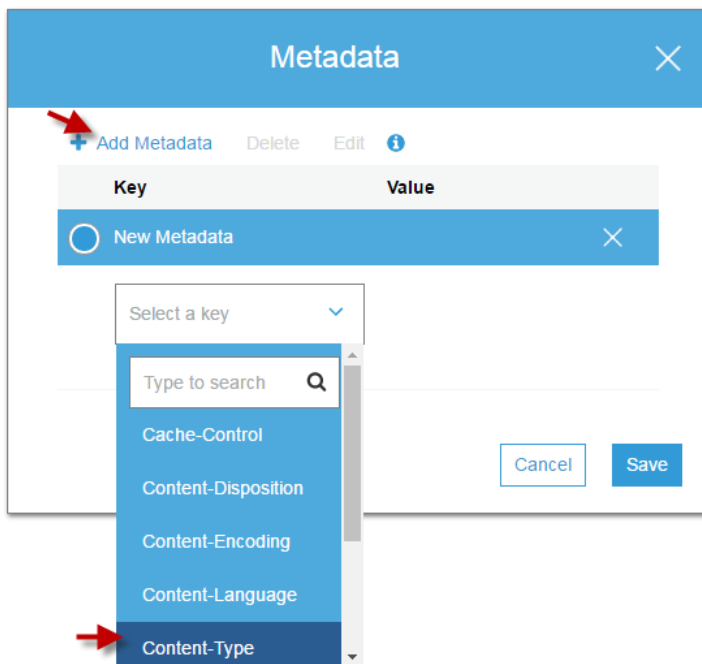

3. In the **Name** list, choose the name of the object that you want to add metadata to.

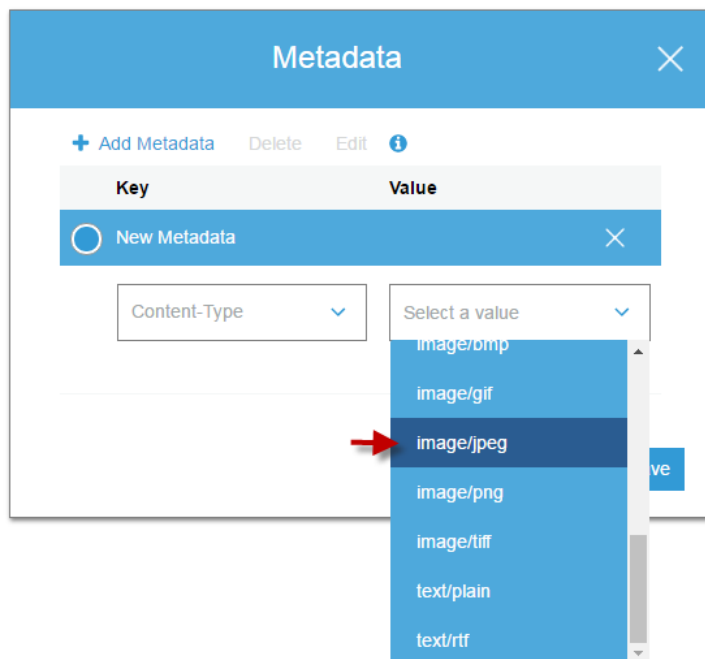

4. Choose **Properties**, and then choose **Metadata**.

5. Choose **Add Metadata**, and then choose a key from the **Select a key** menu.

6. Depending on which key you chose, choose a value from the **Select a value** menu or type a value.

7. Choose **Save**.

Adding User-Defined Metadata to an S3 Object

You can assign user-defined metadata to an object. User-defined metadata must begin with the prefix "x-amz-meta-", otherwise Amazon S3 will not set the key value pair as you define it. You define custom metadata by adding a name that you choose to the x-amz-meta- key. This creates a custom key. For example, if you add the custom name alt-name, the metadata key would be x-amz-meta-alt-name.

User-defined metadata can be as large as 2 KB. Both keys and their values must conform to US-ASCII standards. For more information, see [User-Defined Metadata](#) in the *Amazon Simple Storage Service Developer Guide*.

To add user-defined metadata to an object

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that contains the object.

3. In the **Name** list, choose the name of the object that you want to add metadata to.

4. Choose **Properties**, and then choose **Metadata**.

5. Choose **Add Metadata**, and then choose the **x-amz-meta-** key from the **Select a key** menu. Any metadata starting with the prefix **x-amz-meta-** is user-defined metadata.

6. Type a custom name following the `x-amz-meta-` key. For example, for the custom name `alt-name`, the metadata key would be `x-amz-meta-alt-name`. Enter a value for the custom key, and then choose **Save**.

How Do I Add Tags to an S3 Object?

Object tagging gives you a way to categorize storage. This topic explains how to use the console to add tags to an S3 object after the object has been uploaded. For information about adding tags to an object when the object is being uploaded, see [How Do I Upload Files and Folders to an S3 Bucket? \(p. 38\)](#).

Each tag is a key-value pair that adheres to the following rules:

- You can associate up to 10 tags with an object. Tags associated with an object must have unique tag keys.
- A tag key can be up to 128 Unicode characters in length and tag values can be up to 255 Unicode characters in length.
- Key and tag values are case sensitive.

For more information about object tags, see [Object Tagging](#) in the *Amazon Simple Storage Service Developer Guide*.

To add tags to an object

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that contains the object.

3. In the **Name** list, choose the name of the object you want to add tags to.

4. Choose **Properties**.

The screenshot shows the Amazon S3 console interface for an object named 'example-pic.jpg'. The 'Properties' tab is selected. The 'Tags' section is highlighted, showing '0 Tags'.

How Do I Use Folders in an S3 Bucket?

In Amazon S3, buckets and objects are the primary resources, and objects are stored in buckets. Amazon S3 has a flat structure instead of a hierarchy like you would see in a file system. However, for the sake of organizational simplicity, the Amazon S3 console supports the folder concept as a means of grouping objects. Amazon S3 does this by using a shared name prefix for objects (that is, objects that have names that begin with a common string). Object names are also referred to as *key names*.

For example, you can create a folder on the console named `photos` and store an object named `myphoto.jpg` in it. The object is then stored with the key name `photos/myphoto.jpg`, where `photos/` is the prefix.

Here are two more examples:

- If you have three objects in your bucket—`logs/date1.txt`, `logs/date2.txt`, and `logs/date3.txt`—the console will show a folder named `logs`. If you open the folder in the console, you will see three objects: `date1.txt`, `date2.txt`, and `date3.txt`.
- If you have an object named `photos/2017/example.jpg`, the console will show you a folder named `photos` containing the folder `2017` and the object `example.jpg`.

- [How Do I Delete Folders from an S3 Bucket? \(p. 77\)](#)

You can have folders within folders, but not buckets within buckets. You can upload and copy objects directly into a folder. Folders can be created, deleted, and made public, but they cannot be renamed. Objects can be copied from one folder to another.

Important

The Amazon S3 console treats all objects that have a forward slash ("/") character as the last (trailing) character in the key name as a folder, for example `examplekeyname/`. You can't upload an object that has a key name with a trailing "/" character using the Amazon S3 console. However, you can upload objects that are named with a trailing "/" with the Amazon S3 API by using the AWS CLI, the AWS SDKs, or REST API.

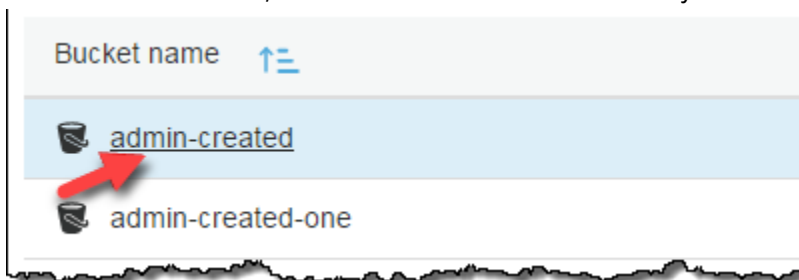

An object that is named with a trailing "/" appears as a folder in the Amazon S3 console. The Amazon S3 console does not display the content and metadata for such an object. When you use the console to copy an object named with a trailing "/", a new folder is created in the destination location, but the object's data and metadata are not copied.

Creating a Folder

This section describes how to use the Amazon S3 console to create a folder.

To create a folder

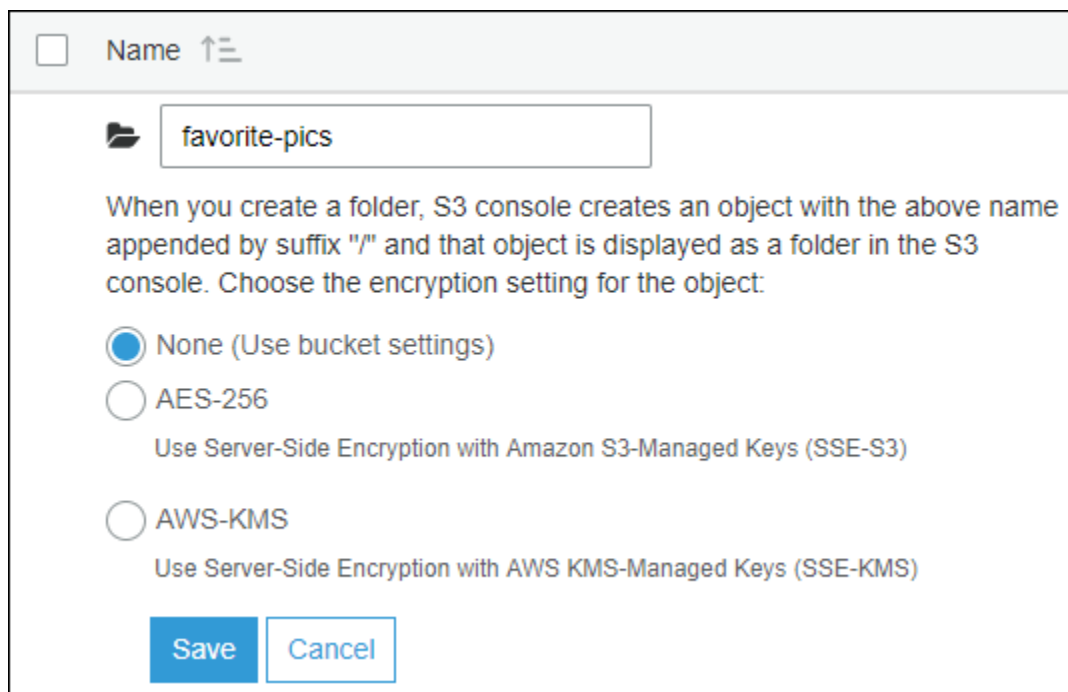

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want to create a folder in.

3. Choose **Create folder**.

4. Enter a name for the folder (for example, **favorite-pics**). Choose the encryption setting for the folder object, and then choose **Save**.

The screenshot shows a dialog box titled 'Name' with a search icon and a list icon. Below the title bar, there is a folder icon and a text input field containing 'favorite-pics'. Below the input field, there is a paragraph of text: 'When you create a folder, S3 console creates an object with the above name appended by suffix "/" and that object is displayed as a folder in the S3 console. Choose the encryption setting for the object:'. Below the text, there are three radio button options: 'None (Use bucket settings)' (selected), 'AES-256' (with subtext 'Use Server-Side Encryption with Amazon S3-Managed Keys (SSE-S3)'), and 'AWS-KMS' (with subtext 'Use Server-Side Encryption with AWS KMS-Managed Keys (SSE-KMS)'). At the bottom, there are two buttons: 'Save' and 'Cancel'.

Making Folders Public

Amazon S3 has a flat structure instead of a hierarchy like you would typically see in a file system. However, for the sake of organizational simplicity, the Amazon S3 console supports a folder concept as a way to group objects. In Amazon S3, the folder is a naming prefix for an object or group of objects. For more information, see [How Do I Use Folders in an S3 Bucket? \(p. 75\)](#)

We recommend blocking all public access to your Amazon S3 folders and buckets unless you specifically require a public folder or bucket. When you make a folder public, anyone on the internet can view all the objects that are grouped in that folder. In the Amazon S3 console, you can make a folder public. You can also make a folder public by creating a bucket policy that limits access by prefix. For more information, see [Setting Bucket and Object Access Permissions \(p. 116\)](#).

Warning

After you make a folder public in the Amazon S3 console, you can't make it private again. Instead, you must set permissions on each individual object in the public folder so that the objects have no public access. For more information, see [How Do I Set Permissions on an Object? \(p. 121\)](#)

Introduction to Amazon S3 Batch Operations

Amazon S3 batch operations performs large-scale batch operations on Amazon S3 objects. You can use Amazon S3 batch operations to copy objects, set object tags or access control lists (ACLs), initiate object restores from Amazon S3 Glacier, or invoke an AWS Lambda function to perform custom actions using your objects. You can perform these operations on a custom list of objects, or you can use an Amazon S3 inventory report to make generating even the largest lists of objects easy. Batch operations use the same Amazon S3 APIs that you already use, so you'll find the interface familiar. For information about performing batch operations using the AWS CLI, AWS SDKs, and the Amazon S3 REST APIs, see [Performing Batch Operations](#) in the *Amazon Simple Storage Service Developer Guide*.

To create a batch job

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. Choose **Batch Operations** on the navigation pane of the Amazon S3 console.
3. Choose **Create job**.
4. Choose the **Region** where you want to create your job.
5. Under **Manifest format** choose the type of manifest object to use.
 - If you choose **S3 Inventory report**, enter the path to the manifest.json object that Amazon S3 generated as part of the CSV-formatted Inventory report, and optionally the version ID for the manifest object if you want to use a version other than the most recent.
 - If you choose **CSV**, enter the path to a CSV-formatted manifest object. The manifest object must follow the format described in the console. You can optionally include the version ID for the manifest object if you want to use a version other than the most recent.
6. Under **Operation** choose the operation that you want to perform on all objects listed in the manifest. Fill out the information for the operation you chose and then choose **Next**.
7. Fill out the information for **Configure additional options** and then choose **Next**.

How Do I Create a Lifecycle Policy for an S3 Bucket?

You can use lifecycle policies to define actions you want Amazon S3 to take during an object's lifetime (for example, transition objects to another storage class, archive them, or delete them after a specified period of time).

You can define a lifecycle policy for all objects or a subset of objects in the bucket by using a shared prefix (that is, objects that have names that begin with a common string).

A versioning-enabled bucket can have many versions of the same object, one current version and zero or more noncurrent (previous) versions. Using a lifecycle policy, you can define actions specific to current and noncurrent object versions. For more information, see [Object Lifecycle Management](#) and [Object Versioning](#) and [Using Versioning](#) in the *Amazon Simple Storage Service Developer Guide*.

To create a lifecycle policy

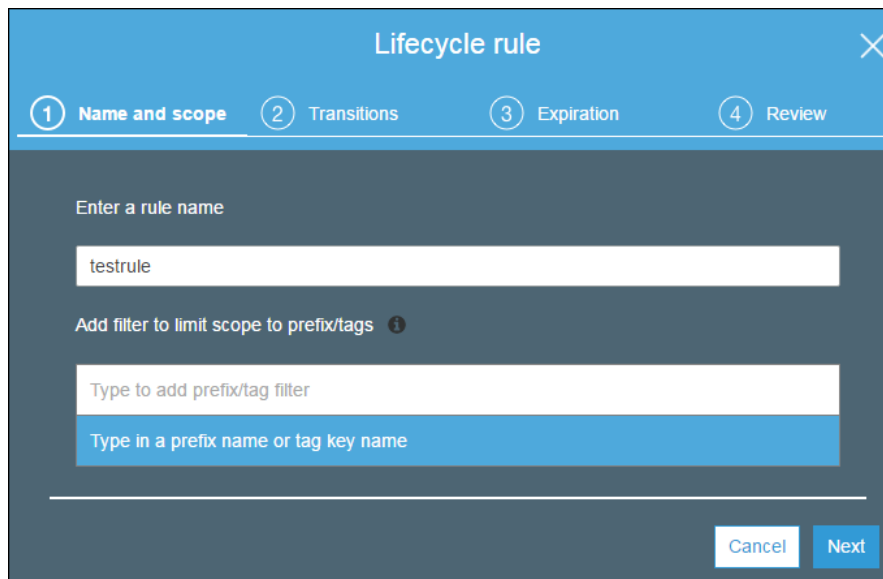

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want to create a lifecycle policy for.

3. Choose the **Management** tab, and then choose **Add lifecycle rule**.

4. In the **Lifecycle rule** dialog box, type a name for your rule to help identify the rule later. The name must be unique within the bucket. Configure the rule as follows:
 - To apply this lifecycle rule to all objects with a specified name prefix (that is, objects with names that begin with a common string), type a prefix in the box, choose the prefix from the drop-down list, and then press **Enter**. For more information about object name prefixes, see [Object Keys](#) in the *Amazon Simple Storage Service Developer Guide*.
 - To apply this lifecycle rule to all objects with one or more object tags, type a tag in the box, choose the tag from the drop-down list, and then press **Enter**. Repeat the procedure to add another tag. You can combine a prefix and tags. For more information about object tags, see [Object Tagging](#) in the *Amazon Simple Storage Service Developer Guide*.
 - To apply this lifecycle rule to all objects in the bucket, choose **Next**.

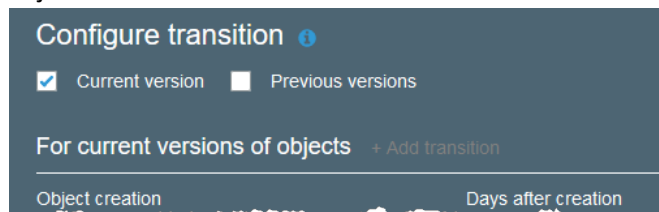

5. You configure lifecycle rules by defining rules to transition objects to the Standard-IA, One Zone-IA, Glacier, and Deep Archive storage classes. For more information, see [Storage Classes](#) in the *Amazon Simple Storage Service Developer Guide*.

You can define transitions for current or previous object versions, or for both current and previous versions. Versioning enables you to keep multiple versions of an object in one bucket. For more information about versioning, see [How Do I Enable or Suspend Versioning for an S3 Bucket?](#) (p. 12).

- a. Select **Current version** to define transitions that are applied to the current version of the object.

Select **Previous versions** to define transitions that are applied to all previous versions of the object.

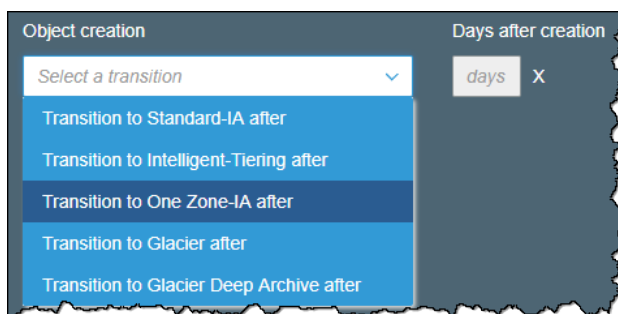

- b. Choose **Add transitions** and specify one of the following transitions:
 - Choose **Transition to Standard-IA after**, and then type the number of days after the creation of an object that you want the transition to be applied (for example, 30 days).

- Choose **Transition to One Zone-IA after**, and then type the number of days after the creation of an object that you want the transition to be applied (for example, 30 days).
- Choose **Transition to Glacier after**, and then type the number of days after the creation of an object that you want the transition to be applied (for example, 100 days).
- Choose **Transition to Glacier Deep Archive after**, and then type the number of days after the creation of an object that you want the transition to be applied (for example, 100 days).

Important

When you choose the Glacier or Glacier Deep Archive storage class, your objects remain in Amazon S3. You cannot access them directly through the separate Amazon S3 Glacier service. For more information, see [Transitioning Objects Using Amazon S3 Lifecycle](#).

6. When you are done configuring transitions, choose **Next**.

7. For this example, select both **Current version** and **Previous versions**.
8. Select **Expire current version of object**, and then enter the number of days after object creation to delete the object (for example, 395 days). If you select this expire option, you cannot select the option to clean up expired delete markers.

9. Select **Permanently delete previous versions**, and then enter the number of days after an object becomes a previous version to permanently delete the object (for example, 465 days).
10. It is a recommended best practice to always select **Clean up incomplete multipart uploads**. For example, type **7** for the number of days after the multipart upload initiation date that you want to end and clean up any multipart uploads that have not completed. For more information about multipart uploads, see [Multipart Upload Overview](#) in the Amazon Simple Storage Service Developer Guide.
11. Choose **Next**.

How Do I Add a Replication Rule to an S3 Bucket?

Replication is the automatic, asynchronous copying of objects across buckets in the same or different AWS Regions. Replication copies newly created objects and object updates from a source bucket to a destination bucket. For more information about replication concepts and how to use replication with the AWS CLI, AWS SDKs, and the Amazon S3 REST APIs, see [Replication](#) in the *Amazon Simple Storage Service Developer Guide*.

Replication requires versioning to be enabled on both the source and destination buckets. To review the full list of requirements, see [Requirements for Replication](#) in the *Amazon Simple Storage Service Developer Guide*. For more information about versioning, see [How Do I Enable or Suspend Versioning for an S3 Bucket?](#) (p. 12)

The object replicas in the destination bucket are exact replicas of the objects in the source bucket. They have the same key names and the same metadata—for example, creation time, owner, user-defined metadata, version ID, access control list (ACL), and storage class. Optionally, you can explicitly specify a different storage class for object replicas. And regardless of who owns the source bucket or the source object, you can choose to change replica ownership to the AWS account that owns the destination bucket. For more information, see [Changing the Replica Owner](#) in the *Amazon Simple Storage Service Developer Guide*.

You can use S3 Replication Time Control (S3 RTC) to replicate your data in the same AWS Region or across different AWS Regions in a predictable timeframe. S3 RTC replicates 99.99 percent of new objects stored in Amazon S3 within 15 minutes and most objects within seconds. For more information, see [Replicating Objects Using S3 Replication Time Control \(S3 RTC\)](#) in the *Amazon Simple Storage Service Developer Guide*.

Note about replication and lifecycle rules

Metadata for an object remains identical between original objects and replica objects. Lifecycle rules abide by the creation time of the original object, and not by when the replicated object becomes available in the destination bucket. However, lifecycle does not act on objects that are pending replication until replication is complete.

You use the Amazon S3 console to add replication rules to the source bucket. Replication rules define which source bucket objects to replicate and the destination bucket where the replicated objects are stored. You can create a rule to replicate all the objects in a bucket or a subset of objects with a specific key name prefix, one or more object tags, or both. A destination bucket can be in the same AWS account as the source bucket, or it can be in a different account.

If the destination bucket is in a different account from the source bucket, you must add a bucket policy to the destination bucket to grant the owner of the source bucket account permission to replicate objects in the destination bucket. The Amazon S3 console builds this required bucket policy for you to copy and add to the destination bucket in the other account.

When you add a replication rule to a bucket, the rule is enabled by default, so it starts working as soon as you save it.

Adding a Replication Rule When the Destination Bucket Is in the Same AWS Account

Follow these steps to configure a replication rule when the destination bucket is in the same AWS account as the source bucket.

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want.

3. Choose **Management**, choose **Replication**, and then choose **Add rule**.

4. In the **Replication rule** wizard, under **Set source**, you have the following options for setting the replication source:
- To replicate the whole bucket, choose **Entire bucket** **bucket-name**.
 - To replicate all objects that have the same prefix (for example, all objects that have names that begin with the string `pictures`), choose **Prefix or tags**. Enter a prefix in the box, choose the prefix from the drop-down list, and then press **Enter**. If you enter a prefix that is the name of a folder, you must use `/` (forward slash) as the last character (for example, `pictures/`). For more information about prefixes, see [Object Keys](#) in the *Amazon Simple Storage Service Developer Guide*.
 - To replicate all objects with one or more object tags, enter a tag in the box, choose the tag from the drop-down list, and then press **Enter**. Enter a tag value and then press **Enter**. Repeat the procedure to add another tag. You can combine a prefix and tags. For more information about object tags, see [Object Tagging](#) in the *Amazon Simple Storage Service Developer Guide*.

The screenshot shows the 'Replication rule' configuration window with a blue header and a progress bar at the top. The progress bar has four steps: 1. Set source (active), 2. Set destination, 3. Configure options, and 4. Review. The 'Set source' section has two radio button options: 'Entire bucket' (with a document icon) and 'Prefix or tags' (with an information icon). The 'Prefix or tags' option is selected. Below the options are two text input fields. The first field has the placeholder text 'Type to add prefix/tag filter'. The second field has the placeholder text 'Type in a prefix name or tag key name'.

The new schema supports prefix and tag filtering and the prioritization of rules. For more information about the new schema, see [Replication Configuration Backward Compatibility](#) in the *Amazon Simple Storage Service Developer Guide*. The developer guide describes the XML used with the Amazon S3 API that works behind the user interface. In the developer guide, the new schema is described as *replication configuration XML V2*.

5. To replicate objects in the source bucket that are encrypted with AWS Key Management Service (AWS KMS), under **Replication criteria**, select **Replicate objects encrypted with AWS KMS**. Under **Choose one or more keys for decrypting source objects** are the source AWS KMS customer master keys (CMKs) that you allow replication to use. All source CMKs are included by default. You can choose to narrow the CMK selection.

Objects encrypted by AWS KMS CMKs that you do not select are not replicated. A CMK or a group of CMKs is chosen for you, but you can choose the CMKs if you want. For information about using AWS KMS with replication, see [Replicating Objects Created with Server-Side Encryption \(SSE\) Using Encryption Keys Stored in AWS KMS](#) in the *Amazon Simple Storage Service Developer Guide*.

The screenshot shows the 'Replication criteria' section of the console. It has a title 'Replication criteria' and a checkbox labeled 'Replicate objects encrypted with AWS KMS' (with an information icon). The checkbox is checked. Below the checkbox is the text 'Choose one or more keys for decrypting source objects'. Under this text is a dropdown menu showing '1 key(s) selected' with a downward arrow. At the bottom right of the section are two buttons: 'Cancel' and 'Next'.

Important

When you replicate objects that are encrypted with AWS KMS, the AWS KMS request rate doubles in the source Region and increases in the destination Region by the same amount. These increased call rates to AWS KMS are due to the way that data is re-encrypted using the customer master key (CMK) that you define for the replication destination Region. AWS KMS has a request rate limit that is per calling account per Region. For information about the limit defaults, see [AWS KMS Limits - Requests per Second: Varies](#) in the *AWS Key Management Service Developer Guide*.

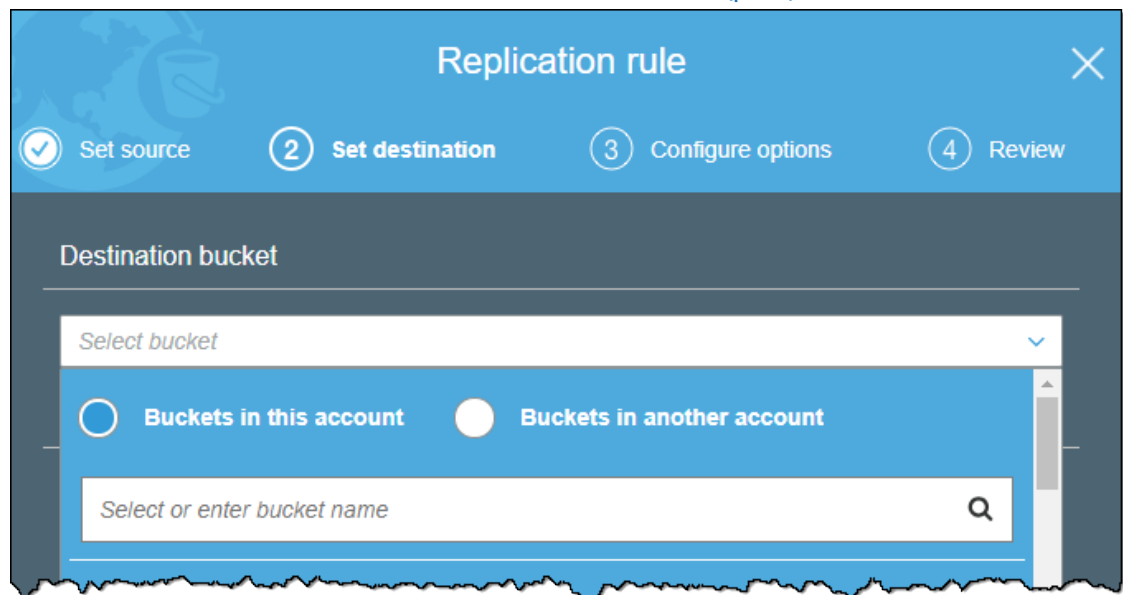

If your current Amazon S3 PUT object request rate during replication is more than half the default AWS KMS rate limit for your account, we recommend that you request an increase to your AWS KMS request rate limit. To request an increase, create a case in the AWS Support Center at [Contact Us](#). For example, suppose that your current PUT object request rate is 1,000 requests per second and you use AWS KMS to encrypt your objects. In this case, we recommend that you ask AWS Support to increase your AWS KMS rate limit to 2,500 requests per second, in both your source and destination Regions (if different), to ensure that there is no throttling by AWS KMS.

To see your PUT object request rate in the source bucket, view `PutRequests` in the Amazon CloudWatch request metrics for Amazon S3. For information about viewing CloudWatch metrics, see [How Do I Configure Request Metrics for an S3 Bucket?](#) (p. 109)

Choose **Next**.

6. To choose a destination bucket from the account that you're currently using, on the **Set destination** page, under **Destination bucket**, choose **Buckets in this account**. Enter the name of the destination bucket for the replication, or choose a name in the drop-down list.

If you want to choose a destination bucket from a different AWS account, see [Adding a Replication Rule When the Destination Bucket Is in a Different AWS Account](#) (p. 93).

If versioning is not enabled on the destination bucket, you get a warning message that contains an **Enable versioning** button. Choose this button to enable versioning on the bucket.

7. If you chose to replicate objects encrypted with AWS KMS, under **Destination encryption settings**, enter the Amazon Resource Name (ARN) of the AWS KMS CMK to use to encrypt the replicas in the destination bucket. You can find the ARN for your AWS KMS CMK in the IAM console, under **Encryption keys**. Or, you can choose a CMK name from the drop-down list.

For more information about creating an AWS KMS CMK, see [Creating Keys](#) in the *AWS Key Management Service Developer Guide*.

8. If you want to replicate your data into a specific storage class in the destination bucket, on the **Set destination** page, under **Destination Options**, select **Change the storage class for the replicated object(s)**. Then choose the storage class that you want to use for the replicated objects in the destination bucket. If you don't select this option, the storage class for replicated objects is the same class as the original objects.

Similarly, if you want to change **Object Ownership** in the destination bucket, choose **Change object ownership to the destination bucket owner**. For more information about this option, see [Adding a Replication Rule When the Destination Bucket Is in a Different AWS Account](#) (p. 93).

If you want to enable S3 Replication Time Control (S3 RTC) in your replication configuration, select **Replication time control**.

Note

When you use S3-RTC, additional per-GB data transfer fees and CloudWatch metrics fees apply.

Choose **Next**.

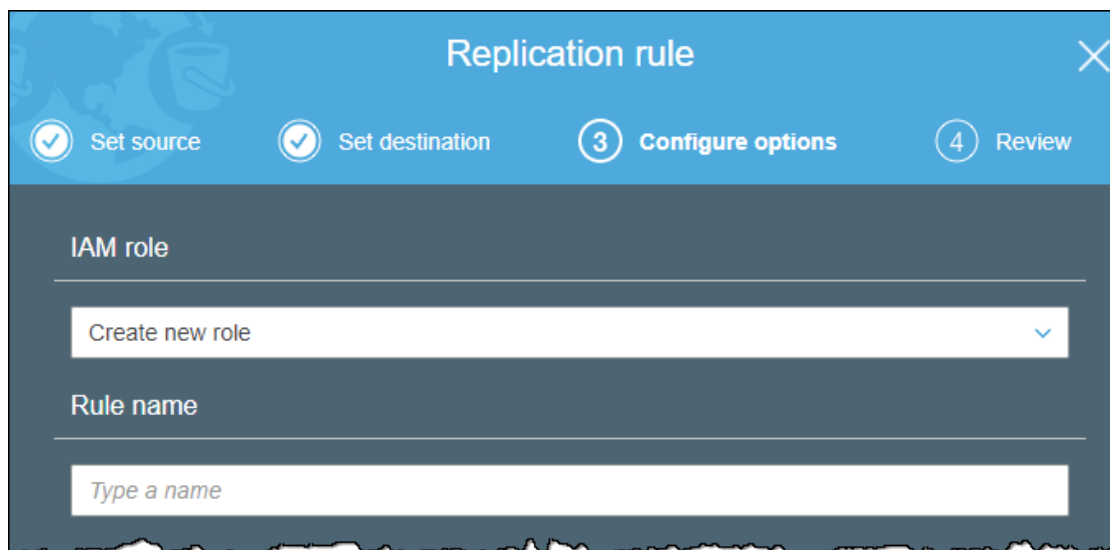

9. Set up an AWS Identity and Access Management (IAM) role that Amazon S3 can assume to replicate objects on your behalf.

To set up an IAM role, on the **Configure options** page, under **Select role**, do one of the following:

- We highly recommend that you choose **Create new role** to have Amazon S3 create a new IAM role for you. When you save the rule, a new policy is generated for the IAM role that matches the source and destination buckets that you choose. The name of the generated role is based on the bucket names and uses the following naming convention: **replication_role_for_source-bucket_to_destination-bucket**.
- You can choose to use an existing IAM role. If you do, you must choose a role that grants Amazon S3 the necessary permissions for replication. Replication fails if this role does not grant Amazon S3 sufficient permissions to follow your replication rule.

Important

When you add a replication rule to a bucket, you must have the `iam:PassRole` permission to be able to pass the IAM role that grants Amazon S3 replication permissions. For more information, see [Granting a User Permissions to Pass a Role to an AWS Service](#) in the *IAM User Guide*.

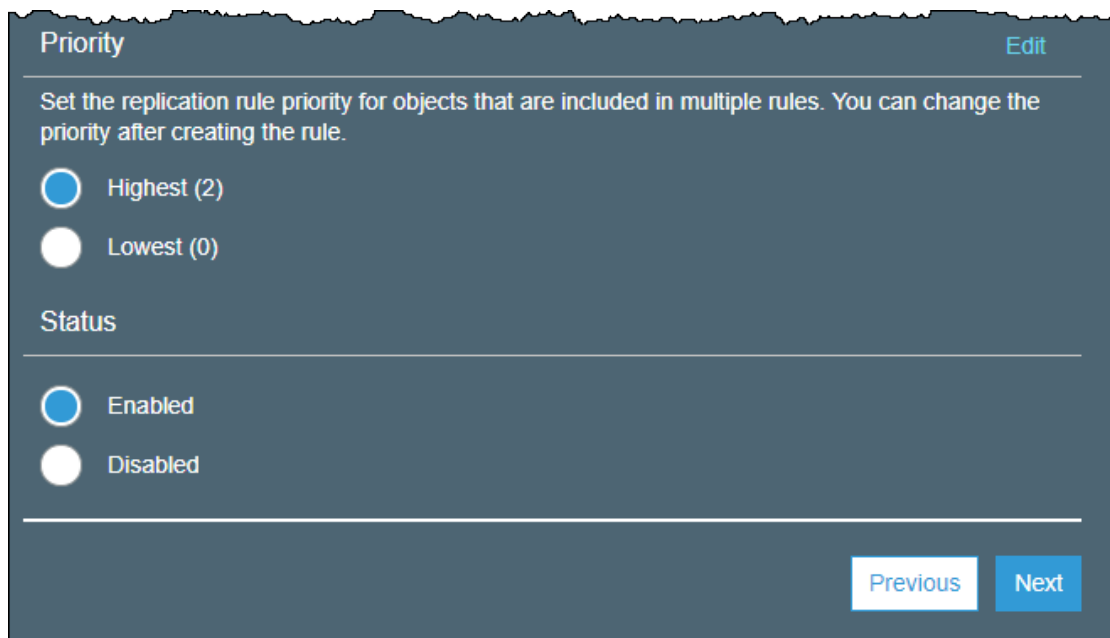

Under **Rule name**, enter a name for your rule to help identify the rule later. The name is required and must be unique within the bucket.

10. If the bucket has existing replication rules, you are instructed to set a priority for the rule. You must set a priority for the rule to avoid conflicts caused by objects that are included in the scope of more than one rule. In the case of overlapping rules, Amazon S3 uses the rule priority to determine which rule to apply. The higher the number, the higher the priority. For more information about rule priority, see [Replication Configuration Overview](#) in the *Amazon Simple Storage Service Developer Guide*.

Under **Status**, **Enabled** is selected by default. An enabled rule starts to work as soon as you save it. If you want to enable the rule later, select **Disabled**.

Choose **Next**.

11. On the **Review** page, review your replication rule. If it looks correct, choose **Save**. Otherwise, choose **Previous** to edit the rule before saving it.
12. After you save your rule, you can edit, enable, disable, or delete your rule on the **Replication** page.

Adding a Replication Rule When the Destination Bucket Is in a Different AWS Account

Follow these steps to configure a replication rule when the destination bucket is in a different AWS account than the source bucket.

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want.

3. Choose **Management**, choose **Replication**, and then choose **Add rule**.

4. If you have never created a replication rule before, start with [Adding a Replication Rule When the Destination Bucket Is in the Same AWS Account](#) (p. 86).

On the **Replication rule** wizard **Set destination** page, under **Destination bucket**, choose **Buckets in another account**. Then enter the name of the destination bucket and the account ID from a different AWS account. Choose **Save**.

For information about adding a bucket policy to an S3 bucket and versioning, see [How Do I Add an S3 Bucket Policy? \(p. 127\)](#) and [How Do I Enable or Suspend Versioning for an S3 Bucket? \(p. 12\)](#)

⚠ Amazon S3 can't detect whether versioning is enabled on the destination bucket.

Amazon S3 must be able to read the versioning property of the destination bucket. Make sure that your destination bucket has the required bucket policy for reading the versioning property, and then try again.

5. If you chose to replicate objects encrypted with AWS KMS, under **Destination encryption settings**, enter the Amazon Resource Name (ARN) AWS KMS CMK to use to encrypt the replicas in the destination bucket.

If you don't select this option, the storage class for replicated objects is the same class as the original objects.
 - To change the object ownership of the replica objects to the destination bucket owner, select **Change object ownership to destination owner**. This option enables you to separate object ownership of the replicated data from the source. If asked, type the account ID of the destination bucket.

When you select this option, regardless of who owns the source bucket or the source object, the AWS account that owns the destination bucket is granted full permission to replica objects. For more information, see [Changing the Replica Owner](#) in the *Amazon Simple Storage Service Developer Guide*.

Grant the Source Bucket Owner Permission to Encrypt Using the AWS KMS CMK

You must grant permissions to the account of the source bucket owner to encrypt using your AWS KMS CMK with a key policy. The following procedure describes how to use the AWS Identity and Access Management (IAM) console to modify the key policy for the AWS KMS CMK that is being used to encrypt the replica objects in the destination bucket.

To grant permissions to encrypt using your AWS KMS CMK

1. Sign in to the AWS Management Console using the AWS account that owns the AWS KMS CMK. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the left navigation pane, choose **Encryption keys**.
3. For **Region**, choose the appropriate AWS Region. Do not use the Region selector in the navigation bar (upper-right corner).
4. Choose the alias of the CMK that you want to encrypt with.
5. In the **Key Policy** section of the page, choose **Switch to policy view**.
6. Using the **Key Policy** editor, insert the key policy provided by Amazon S3 into the existing key policy, and then choose **Save Changes**. You might want to add the policy to the end of the existing policy.

For more information about creating and editing AWS KMS CMKs, see [Getting Started](#) in the *AWS Key Management Service Developer Guide*.

How Do I Manage the Replication Rules for an S3 Bucket?

Replication is the automatic, asynchronous copying of objects across buckets in the same or different AWS Regions. It replicates newly created objects and object updates from a source bucket to a specified destination bucket.

You use the Amazon S3 console to add replication rules to the source bucket. Replication rules define the source bucket objects to replicate and the destination bucket where the replicated objects are stored. For more information about replication, see [Replication](#) in the *Amazon Simple Storage Service Developer Guide*.

You can manage replication rules on the **Replication** page. You can add, view, enable, disable, delete, and change the priority of the replication rules. For information about adding replication rules to a bucket, see [How Do I Add a Replication Rule to an S3 Bucket?](#) (p. 85).

To manage the replication rules for an S3 bucket

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want.

3. Choose **Management**, and then choose **Replication**.

4. You change the replication rules in the following ways.

- To change settings that affect all the replication rules in the bucket, choose **Edit global settings**.

Source	Destination	Permissions	Edit global settings
Bucket admin-created	Bucket ca-example-bucket	IAM role s3crr_role_for_admin-created_to_ca-example-bucket	
Region US West (Oregon)	Region US West (N. California)	Bucket policy Copy	

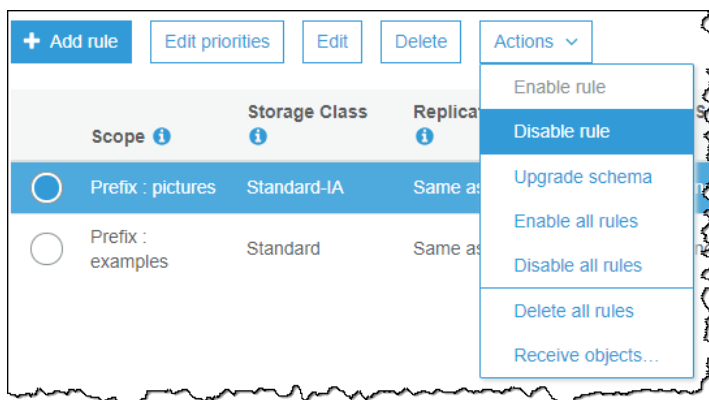

You can change the destination bucket, and the IAM role. If needed, you can copy the required bucket policy for cross-account destination buckets.

Source	Destination	Permissions	Cancel	Save
Bucket admin-created	Bucket <input type="text" value="ca-example-bucket"/>	IAM role <input type="text" value="s3crr_role_for_admin-..."/>		
Region US West (Oregon)		Bucket policy Copy		

- To change a replication rule, select the rule and choose **Edit**, which starts the Replication wizard to help you make the change. For information about using the wizard, see [How Do I Add a Replication Rule to an S3 Bucket?](#) (p. 85).

+ Add rule	Edit priorities	Edit	Delete	Actions ▾
Scope ⓘ	Storage Class ⓘ	Replicated object owner ⓘ		
<input checked="" type="radio"/> Prefix : pictures	Standard-IA	Same as source bucket		
<input type="radio"/> Prefix : examples	Standard	Same as source bucket		

- To enable or disable a replication rule, select the rule, choose **More**, and in the drop-down list, choose **Enable rule** or **Disable rule**. You can also disable, enable, or delete all the rules in the bucket from the **More** drop-down list.

- To change the rule priorities, choose **Edit priorities**. You can then change the priority for each rule under the **Priority** column heading. Choose **Save** to save your changes.

You set rule priorities to avoid conflicts caused by objects that are included in the scope of more than one rule. In the case of overlapping rules, Amazon S3 uses the rule priority to determine which rule to apply. The higher the number, the higher the priority. For more information about rule priority, see [Replication Configuration Overview](#) in the *Amazon Simple Storage Service Developer Guide*.

How Do I Configure Storage Class Analysis?

By using the Amazon S3 analytics storage class analysis tool, you can analyze storage access patterns to help you decide when to transition the right data to the right storage class. Storage class analysis observes data access patterns to help you determine when to transition less frequently accessed STANDARD storage to the STANDARD_IA (IA, for infrequent access) storage class. For more information about STANDARD_IA, see the [Amazon S3 FAQ](#) and [Storage Classes](#) in the *Amazon Simple Storage Service Developer Guide*.

Important

Storage class analysis does not give recommendations for transitions to the ONEZONE_IA or GLACIER storage classes.

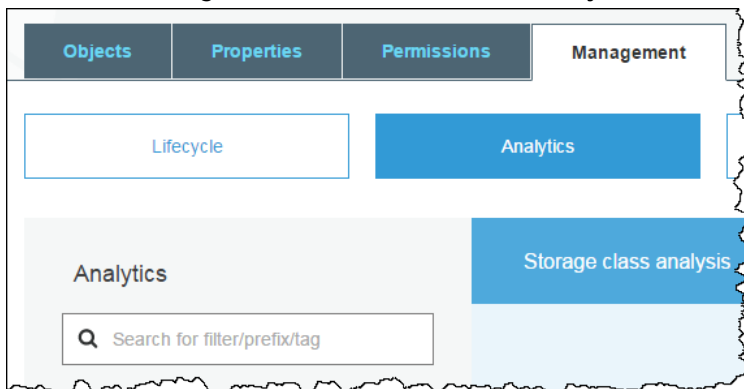

For more information about analytics, see [Amazon S3 Analytics – Storage Class Analysis](#) in the *Amazon Simple Storage Service Developer Guide*.

To configure storage class analysis

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket for which you want to configure storage class analysis.

3. Choose the **Management** tab, and then choose **Analytics**.

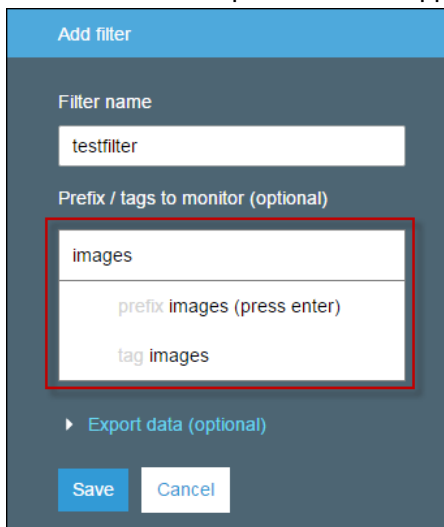

4. Choose **Add**.

5. Type a name for the filter. If you want to analyze the whole bucket, leave the **Prefix / tags** field empty.

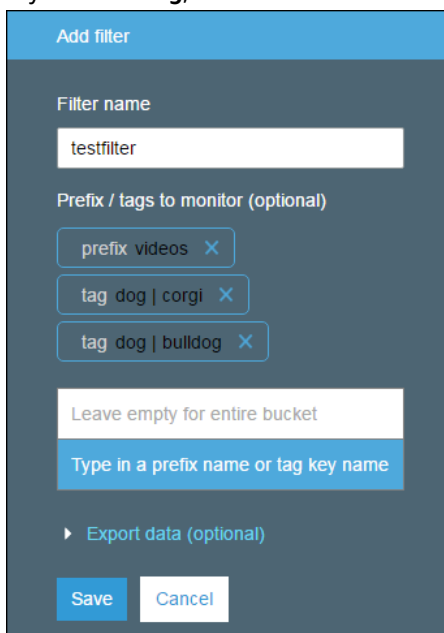

A screenshot of the 'Add filter' dialog box in the Amazon S3 console. The dialog box has a title bar 'Add filter'. Inside, there is a 'Filter name' field with a placeholder text 'Enter a name for this filter'. Below it is a 'Prefix / tags to monitor (optional)' field with a placeholder text 'Leave empty for entire bucket'. At the bottom, there is a section for 'Export data (optional)' with a plus sign icon. At the very bottom, there are two buttons: 'Save' and 'Cancel'.

6. In the **Prefix / tags** field, type text for the prefix or tag for the objects that you want to analyze, or choose from the dropdown list that appears when you start typing.

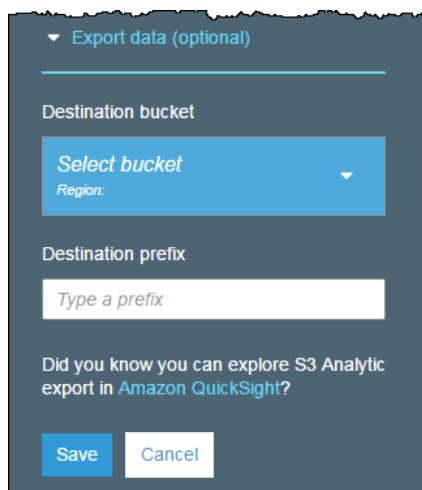

The screenshot shows the 'Add filter' dialog box. The 'Filter name' field contains 'testfilter'. The 'Prefix / tags to monitor (optional)' dropdown menu is open, showing a list of suggestions: 'images', 'prefix images (press enter)', and 'tag images'. The 'images' option is highlighted. Below the dropdown is a link for 'Export data (optional)'. At the bottom are 'Save' and 'Cancel' buttons.

7. If you chose **tag**, enter a value for the tag. You can enter one prefix and multiple tags.

The screenshot shows the 'Add filter' dialog box. The 'Filter name' field contains 'testfilter'. The 'Prefix / tags to monitor (optional)' field contains three tags: 'prefix videos', 'tag dog | corgi', and 'tag dog | bulldog'. Each tag has a small 'X' icon to its right. Below the tags is a text input field with the placeholder 'Leave empty for entire bucket' and a blue button with the text 'Type in a prefix name or tag key name'. Below this is a link for 'Export data (optional)'. At the bottom are 'Save' and 'Cancel' buttons.

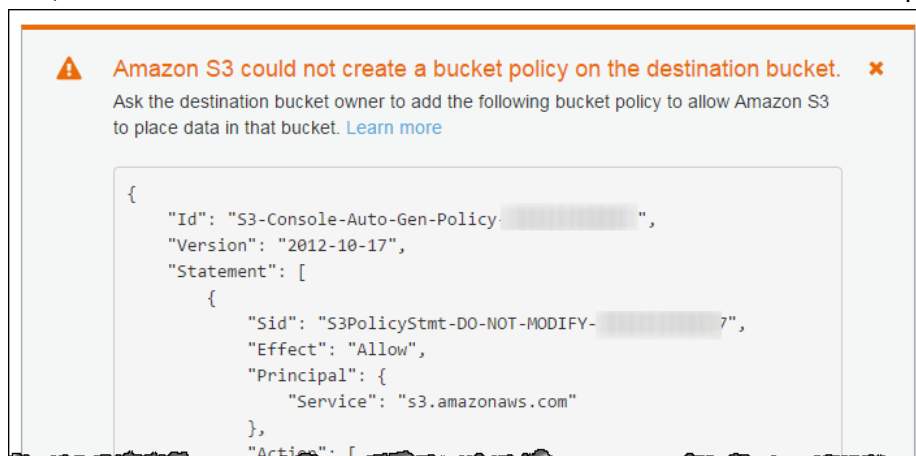

8. Optionally, you can choose **Export data** to export analysis reports to a comma-separated values (.csv) flat file. Choose a destination bucket where the file can be stored. You can type a prefix for the destination bucket. The destination bucket must be in the same AWS Region as the bucket for which you are setting up the analysis. The destination bucket can be in a different AWS account.

9. Choose **Save**.

Amazon S3 creates a bucket policy on the destination bucket that grants Amazon S3 write permission. This allow it to write the export data to the bucket.

If an error occurs when you try to create the bucket policy, you'll be given instructions on how to fix it. For example, if you chose a destination bucket in another AWS account and do not have permissions to read and write to the bucket policy, you'll see the following message. You must have the destination bucket owner add the displayed bucket policy to the destination bucket. If the policy is not added to the destination bucket you won't get the export data because Amazon S3 doesn't have permission to write to the destination bucket. If the source bucket is owned by a different account than that of the current user, then the correct account ID of the source bucket must be substituted in the policy.

For information about the exported data and how the filter works, see [Amazon S3 Analytics – Storage Class Analysis](#) in the *Amazon Simple Storage Service Developer Guide*.

How Do I Configure Amazon S3 Inventory?

Amazon S3 inventory provides a flat file list of your objects and metadata, which is a scheduled alternative to the Amazon S3 synchronous `List` API operation. Amazon S3 inventory provides comma-separated values (CSV) or [Apache optimized row columnar \(ORC\)](#) or [Apache Parquet \(Parquet\)](#) output files that list your objects and their corresponding metadata on a daily or weekly basis for an S3 bucket or for objects that share a prefix (objects that have names that begin with the same string). For more information, see [Amazon S3 Inventory](#) in the *Amazon Simple Storage Service Developer Guide*.

To configure inventory

Note

It may take up to 48 hours to deliver the first report.

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket for which you want to configure Amazon S3 inventory.

3. Choose the **Management** tab, and then choose **Inventory**.
4. Choose **Add new**.
5. Type a name for the inventory and set it up as follows:
 - Optionally, add a prefix for your filter to inventory only objects whose names begin with the same string.
 - Choose the destination bucket where you want reports to be saved. The destination bucket must be in the same AWS Region as the bucket for which you are setting up the inventory. The destination bucket can be in a different AWS account.
 - Optionally, choose a prefix for the destination bucket.
 - Choose how frequently to generate the inventory.

6. Under **Advanced settings**, you can set the following:
 - a. Choose either the CSV, ORC, or Parquet output file format for your inventory. For more information about these formats, see [Amazon S3 Inventory](#) in the *Amazon Simple Storage Service Developer Guide*.

The screenshot shows the 'Advanced settings' dialog box for configuring an Amazon S3 Inventory. It includes the following sections:

- Output format:** A heading with a link to 'Learn more'. It contains three radio buttons: 'CSV' (selected), 'Apache ORC', and 'Apache Parquet'. A note below the 'CSV' option states: 'Choose this format for listing 1 million or fewer objects, or if you plan to analyze S3 Inventory with tools like Excel.'
- Object versions:** A dropdown menu currently set to 'Current version only'.
- Optional fields:** A list of checkboxes. 'Size' is checked. 'Last modified date' is unchecked. 'Storage class' is checked. 'Etag' is unchecked. 'Multipart upload' is unchecked. 'Replication status' is unchecked. 'Encryption status' is checked. 'All object lock configurations (3 selected)' is checked, and it is expanded to show three sub-items: 'Retention mode' (checked), 'Retain until date' (checked), and 'Legal hold status' (checked).
- Encryption:** Three radio buttons: 'None' (selected), 'AES-256', and 'AWS-KMS'.

At the bottom of the dialog are 'Cancel' and 'Save' buttons.

- b. To include all versions of the objects in the inventory, choose **Include all versions** in the **Object versions** list. By default, the inventory includes only the current versions of the objects.
- c. For **Optional fields**, select one or more of the following to add to the inventory report:
- **Size** – Object size in bytes.
 - **Last modified date** – The object creation date or the last modified date, whichever is the latest.
 - **Storage class** – The storage class used for storing the object.
 - **ETag** – The entity tag is a hash of the object. The ETag reflects changes only to the contents of an object, and not its metadata. The ETag may or may not be an MD5 digest of the object data. Whether it is depends on how the object was created and how it is encrypted.
 - **Multipart upload** – Specifies that the object was uploaded as a multipart upload. For more information, see [Multipart Upload Overview](#) in the *Amazon Simple Storage Service Developer Guide*.
 - **Replication status** – The replication status of the object. For more information, see [How Do I Add a Replication Rule to an S3 Bucket? \(p. 85\)](#).
 - **Encryption status** – The server-side encryption used to encrypt the object. For more information, see [Protecting Data Using Server-Side Encryption](#) in the *Amazon Simple Storage Service Developer Guide*.
 - **Object lock configurations** – The object lock status of the object, including the following settings:
 - **Retention mode** – The level of protection applied to the object, either *Governance* or *Compliance*.
 - **Retain until date** – The date until which the locked object cannot be deleted.
 - **Legal hold status** – The legal hold status of the locked object.

For information about object lock, see [Amazon S3 Object Lock Overview](#) in the *Amazon Simple Storage Service Developer Guide*.

For more information about the contents of an inventory report, see [What's Included in an Amazon S3 Inventory?](#) in the *Amazon Simple Storage Service Developer Guide*.

- d. For **Encryption**, choose a server-side encryption option to encrypt the inventory report, or choose **None**:
- **None** – Do not encrypt the inventory report.
 - **AES-256** – Encrypt the inventory report using server-side encryption with Amazon S3-managed keys (SSE-S3). Amazon S3 server-side encryption uses 256-bit Advanced Encryption Standard (AES-256). For more information, see [Amazon S3-Managed Encryption Keys \(SSE-S3\)](#) in the *Amazon Simple Storage Service Developer Guide*.
 - **AWS-KMS** – Encrypt the report using server-side encryption with AWS Key Management Service (AWS KMS) customer master keys (CMKs). For more information, see [AWS KMS CMKs](#) in the *Amazon Simple Storage Service Developer Guide*.

Note

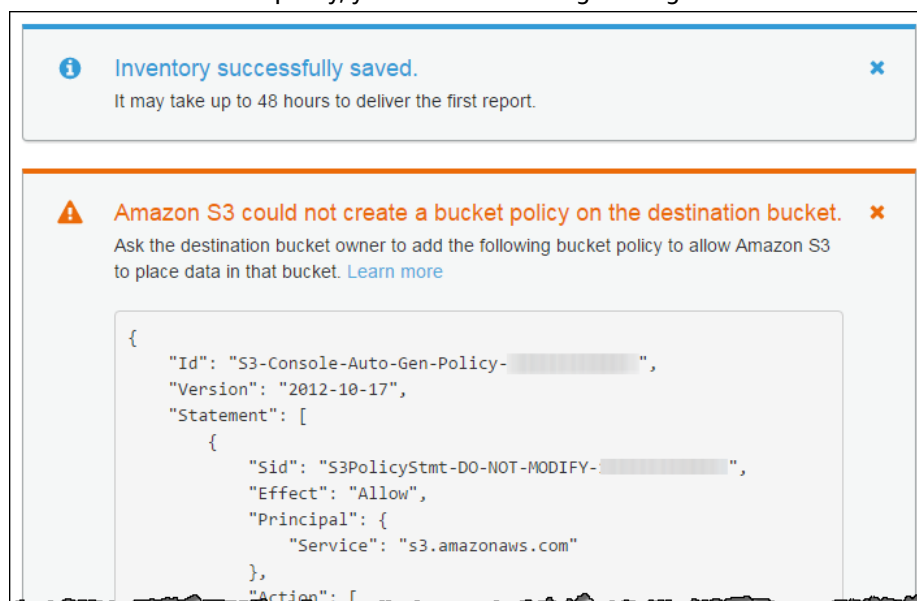

To encrypt the inventory list file with SSE-KMS, you must grant Amazon S3 permission to use the AWS KMS CMK. For instructions, see [Grant Amazon S3 Permission to Encrypt Using Your AWS KMS CMK \(p. 109\)](#).

7. Choose **Save**.

Destination Bucket Policy

Amazon S3 creates a bucket policy on the destination bucket that grants Amazon S3 write permission. This allows Amazon S3 to write data for the inventory reports to the bucket.

If an error occurs when you try to create the bucket policy, you are given instructions on how to fix it. For example, if you choose a destination bucket in another AWS account and don't have permissions to read and write to the bucket policy, you see the following message.

In this case, the destination bucket owner must add the displayed bucket policy to the destination bucket. If the policy is not added to the destination bucket, you won't get an inventory report because Amazon S3 doesn't have permission to write to the destination bucket. If the source bucket is owned by

a different account than that of the current user, the correct account ID of the source bucket must be substituted in the policy.

For more information, see [Amazon S3 Inventory](#) in the *Amazon Simple Storage Service Developer Guide*.

Grant Amazon S3 Permission to Encrypt Using Your AWS KMS CMK

You must grant Amazon S3 permission to encrypt using your AWS KMS CMK with a key policy. The following procedure describes how to use the AWS Identity and Access Management (IAM) console to modify the key policy for the AWS KMS CMK that is being used to encrypt the inventory file.

To grant permissions to encrypt using your AWS KMS CMK

1. Sign in to the AWS Management Console using the AWS account that owns the AWS KMS CMK. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the left navigation pane, choose **Encryption keys**.
3. For **Region**, choose the appropriate AWS Region. Do not use the region selector in the navigation bar (upper-right corner).
4. Choose the alias of the CMK that you want to encrypt inventory with.
5. In the **Key Policy** section of the page, choose **Switch to policy view**.
6. Using the **Key Policy** editor, insert following key policy into the existing policy and then choose **Save Changes**. You might want to copy the policy to the end of the existing policy.

```
{
  "Sid": "Allow Amazon S3 use of the key",
  "Effect": "Allow",
  "Principal": {
    "Service": "s3.amazonaws.com"
  },
  "Action": [
    "kms:GenerateDataKey*"
  ],
  "Resource": "*"
}
```

How Do I Configure Request Metrics for an S3 Bucket?

There are three types of Amazon CloudWatch metrics for Amazon S3:

- *Storage metrics* are reported once per day and are provided to all customers at no additional cost.
- *Replication metrics* are available 15 minutes after enabling a replication rule with S3 Replication Time Control (S3 RTC). For more information, see [How Do I View Replication Metrics? \(p. 114\)](#)

- *Request metrics* are available at 1-minute intervals after some latency to process, and the metrics are billed at the standard CloudWatch rate.

For more information about CloudWatch metrics for Amazon S3, see [Monitoring Metrics with Amazon CloudWatch](#) in the *Amazon Simple Storage Service Developer Guide*.

To get request metrics, you must opt into them by configuring them on the AWS Management Console or using the Amazon S3 API.

To configure request metrics on a bucket

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that contains the objects you want request metrics for.

3. Choose the **Management** tab, and then choose **Metrics**.

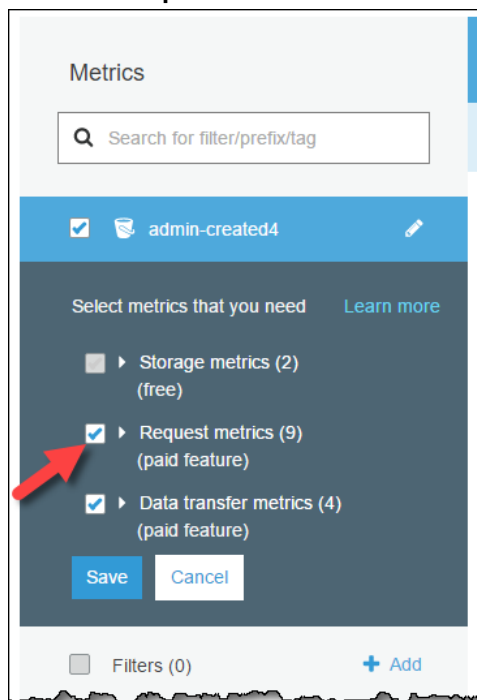

4. Choose **Requests**.

5. In the left pane, choose the edit icon next to the name of the bucket.

6. Select the **Request metrics** check box. This also enables data transfer metrics.

7. Choose **Save**.

You have now created a metrics configuration for all the objects in an Amazon S3 bucket. About 15 minutes after CloudWatch begins tracking these request metrics, you can see graphs for the metrics on the Amazon S3 or CloudWatch console.

You can also define a filter so that the metrics are only collected and reported on a subset of objects in the bucket. For more information, see [How Do I Configure a Request Metrics Filter? \(p. 111\)](#)

How Do I Configure a Request Metrics Filter?

There are three types of Amazon CloudWatch metrics for Amazon S3: storage metrics, request metrics and replication. Storage metrics are reported once per day and are provided to all customers at no additional cost. Request metrics are available at 1 minute intervals after some latency to process, and metrics are billed at the standard CloudWatch rate. To get request metrics, you must opt into them by configuring them in the console or with the Amazon S3 API.

For more conceptual information about CloudWatch metrics for Amazon S3, see [Monitoring Metrics with Amazon CloudWatch](#) in the *Amazon Simple Storage Service Developer Guide*.

To filter request metrics on a subset of objects in a bucket

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that has the objects you want to get request metrics for.

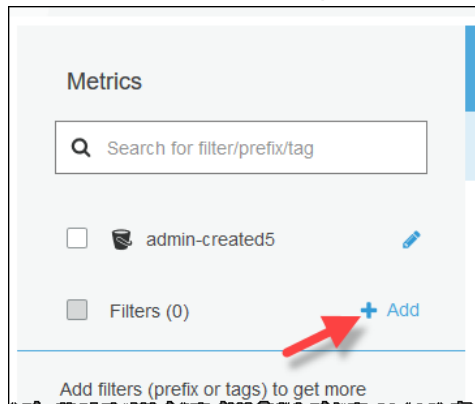

3. Choose the **Management** tab, and then choose **Metrics**.

4. Choose **Requests**.

5. From **Filters** in the left-side pane, choose **Add**.

6. Provide a name for this metrics configuration.

The screenshot shows the 'Metrics' section of the Amazon S3 console. At the top, there is a search bar labeled 'Search for filter/prefix/tag'. Below it, there is a list of filters, currently empty, with a '+ Add' button. The 'Add filter' dialog is open, showing the 'Filter name' field with the text 'Monthly Release'. A red arrow points to the 'Prefix / tags that you want to monitor' section, which contains a text input field labeled 'Type to add prefix/tag filter'. At the bottom of the dialog are 'Save' and 'Cancel' buttons.

7. Provide one or more prefixes or tags, separated by commas, in **Prefix /tags that you want to monitor**. From the drop down, select whether the value you provided is a tag or a prefix.

This screenshot shows the 'Add filter' dialog after the first step. The 'Filter name' field still contains 'Monthly Release'. In the 'Prefix / tags that you want to monitor' section, there is now a dropdown menu showing 'prefix music' with a blue 'X' icon to its right. Below this, there is a text input field containing the word 'music'. A red arrow points to this input field. The 'Save' and 'Cancel' buttons remain at the bottom.

8. Choose **Save**.

You have now created a metrics configuration for request metrics on a subset of the objects in an Amazon S3 bucket. About 15 minutes after CloudWatch begins tracking these request metrics, you can see graphs for the metrics in both the Amazon S3 or CloudWatch consoles. You can also request metrics at the bucket level. For information, see [How Do I Configure Request Metrics for an S3 Bucket?](#) (p. 109)

How Do I View Replication Metrics?

There are three types of Amazon CloudWatch metrics for Amazon S3: storage metrics, request metrics, and replication metrics. *Replication* metrics are available 15 minutes after a replication rule with S3 Replication Time Control (S3 RTC) has been enabled. Replication metrics are billed at the standard Amazon CloudWatch rate. They are turned on automatically when you enable replication with S3 RTC using the AWS Management Console or the Amazon S3 API.

Replication metrics track the rule IDs of the replication configuration. A replication rule ID can be specific to a prefix, a tag, or a combination of both. For more information about S3 Replication Time Control (S3 RTC), see [Replicating Objects Using S3 Replication Time Control \(S3 RTC\)](#) in the *Amazon Simple Storage Service Developer Guide*.

For more information about CloudWatch metrics for Amazon S3, see [Monitoring Metrics with Amazon CloudWatch](#) in the *Amazon Simple Storage Service Developer Guide*.

To view replication metrics

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that contains the objects you want replication metrics for.

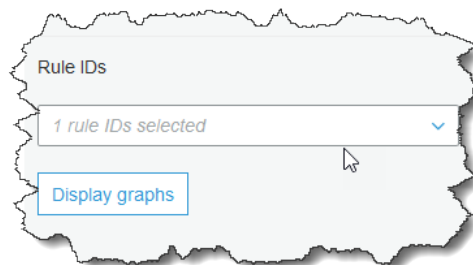

3. Choose the **Management** tab, and then choose **Metrics**.

4. Choose **Replication**.
Console screenshot showing replication option.
5. In the **Rule IDs** list in the left pane, select the rule IDs that you want. If you have several rule IDs to choose from, you can search for the IDs that you want.

6. After choosing the rule IDs that you want, choose **Display graphs** below the **Rule IDs** selection box.

You can then view the replication metrics **Replication Latency (in seconds)**, **Operations pending replication**, and **Bytes pending replication** for the rules that you selected. Amazon CloudWatch begins reporting replication metrics 15 minutes after you enable S3 RTC on the respective replication rule. You can view replication metrics on the Amazon S3 or CloudWatch console. For information, see [Using Replication Metrics to Monitor Replication Configurations](#) in the *Amazon Simple Storage Service Developer Guide*.

Setting Bucket and Object Access Permissions

This section explains how to use the Amazon Simple Storage Service (Amazon S3) console to grant access permissions to your buckets and objects. It also explains how to use Amazon S3 block public access to prevent the application of any settings that allow public access to data within S3 buckets.

Buckets and objects are Amazon S3 resources. You grant access permissions to your buckets and objects by using resource-based access policies. You can associate an access policy with a resource. An access policy describes who has access to resources. The resource owner is the AWS account that creates the resource. For more information about resource ownership and access policies, see [Overview of Managing Access](#) in the *Amazon Simple Storage Service Developer Guide*.

Bucket access permissions specify which users are allowed access to the objects in a bucket and which types of access they have. *Object access permissions* specify which users are allowed access to the object and which types of access they have. For example, one user might have only read permission, while another might have read and write permissions.

Bucket and object permissions are independent of each other. An object does not inherit the permissions from its bucket. For example, if you create a bucket and grant write access to a user, you can't access that user's objects unless the user explicitly grants you access.

To grant access to your buckets and objects to other AWS accounts and to the general public, you use resource-based access policies known as *access control lists* (ACLs).

A *bucket policy* is a resource-based AWS Identity and Access Management (IAM) policy that grants other AWS accounts or IAM users access to an S3 bucket. Bucket policies supplement, and in many cases, replace ACL-based access policies. For more information about using IAM with Amazon S3, see [Managing Access Permissions to Your Amazon S3 Resources](#) in the *Amazon Simple Storage Service Developer Guide*.

For more in-depth information about managing access permissions, see [Introduction to Managing Access Permissions to Your Amazon S3 Resources](#) in the *Amazon Simple Storage Service Developer Guide*.

This section also explains how to use the Amazon S3 console to add a cross-origin resource sharing (CORS) configuration to an S3 bucket. CORS allows client web applications that are loaded in one domain to interact with resources in another domain.

How Do I Block Public Access to S3 Buckets?

Amazon S3 block public access prevents the application of any settings that allow public access to data within S3 buckets. You can configure block public access settings for an individual S3 bucket or for all the buckets in your account. For information about blocking public access using the AWS CLI, AWS SDKs,

and the Amazon S3 REST APIs, see [Using Amazon S3 Block Public Access](#) in the *Amazon Simple Storage Service Developer Guide*.

The following topics explain how to use the Amazon S3 console to configure block public access settings:

- [How Do I Edit Public Access Settings for S3 Buckets?](#) (p. 118)
- [How Do I Edit Public Access Settings for All the S3 Buckets in an AWS Account?](#) (p. 120)

The following sections explain viewing bucket access status and searching by access types.

Viewing Access Status

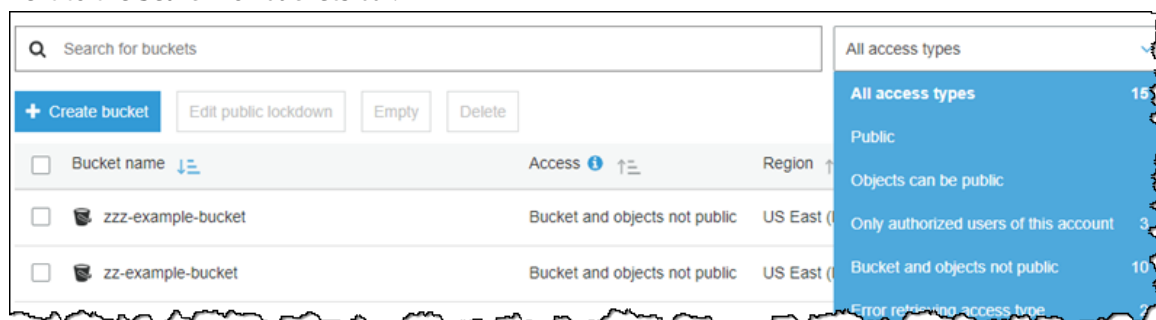

The list buckets view shows whether your bucket is publicly accessible. Amazon S3 labels the permissions for a bucket as follows:

- **Public** – Everyone has access to one or more of the following: List objects, Write objects, Read and write permissions.
- **Objects can be public** – The bucket is not public, but anyone with the appropriate permissions can grant public access to objects.
- **Buckets and objects not public** – The bucket and objects do not have any public access.
- **Only authorized users of this account** – Access is isolated to IAM users and roles in this account and AWS service principals because there is a policy that grants public access.

The access column shows the access status of the listed buckets.

<input type="checkbox"/> Bucket name	Access	Region
<input type="checkbox"/> zzz-example-bucket	Bucket and objects not public	US East (N. Virginia)
<input type="checkbox"/> zz-example-bucket	Only authorized users of this account	US East (N. Virginia)
<input type="checkbox"/> example-bucket-77	Error	US East (N. Virginia)

You can also filter bucket searches by access type. Choose an access type from the drop-down list that is next to the **Search for buckets** bar.

How Do I Set Permissions on an Object?

This section explains how to use the Amazon Simple Storage Service (Amazon S3) console to manage access permissions for an Amazon S3 object by using access control lists (ACLs). ACLs are resource-based access policies that grant access permissions to buckets and objects. For more information about managing access permissions with resource-based policies, see [Overview of Managing Access](#) in the *Amazon Simple Storage Service Developer Guide*.

Bucket and object permissions are independent of each other. An object does not inherit the permissions from its bucket. For example, if you create a bucket and grant write access to a user, you can't access that user's objects unless the user explicitly grants you access.

You can grant permissions to other AWS accounts or predefined groups. The user or group that you grant permissions to is called the *grantee*. By default, the owner, which is the AWS account that created the bucket, has full permissions.

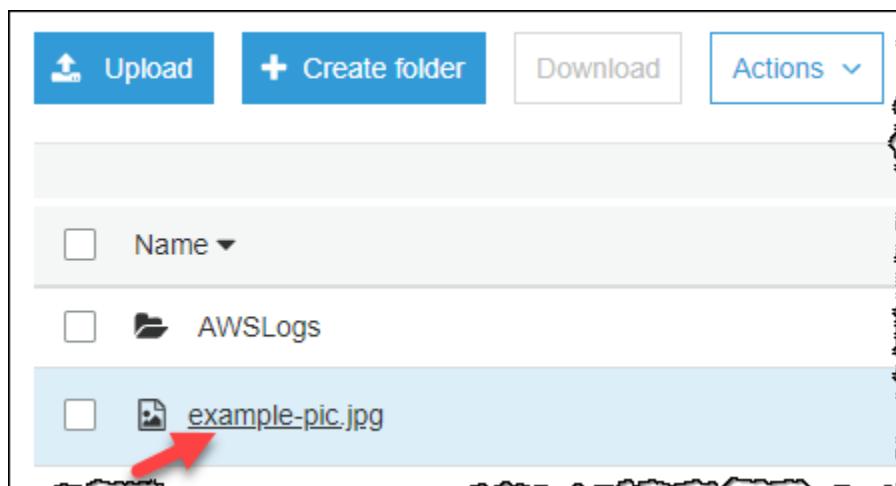

Each permission you grant for a user or a group adds an entry in the ACL that is associated with the object. The ACL lists grants, which identify the grantee and the permission granted. For more information about ACLs, see [Managing Access with ACLs](#) in the *Amazon Simple Storage Service Developer Guide*.

To set permissions for an object

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that contains the object.

3. In the **Name** list, choose the name of the object for which you want to set permissions.

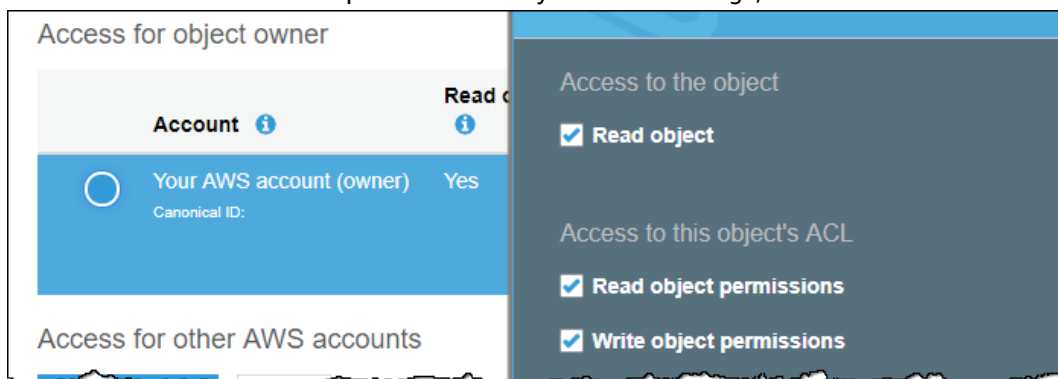

4. Choose **Permissions**.
5. You can manage object access permissions for the following:

- a. **Access for object owner**

The *owner* refers to the AWS account root user, and not an AWS Identity and Access Management (IAM) user. For more information about the root user, see [The AWS Account Root User](#) in the *IAM User Guide*.

To change the owner's object access permissions, under **Access for object owner**, choose **Your AWS Account (owner)**.

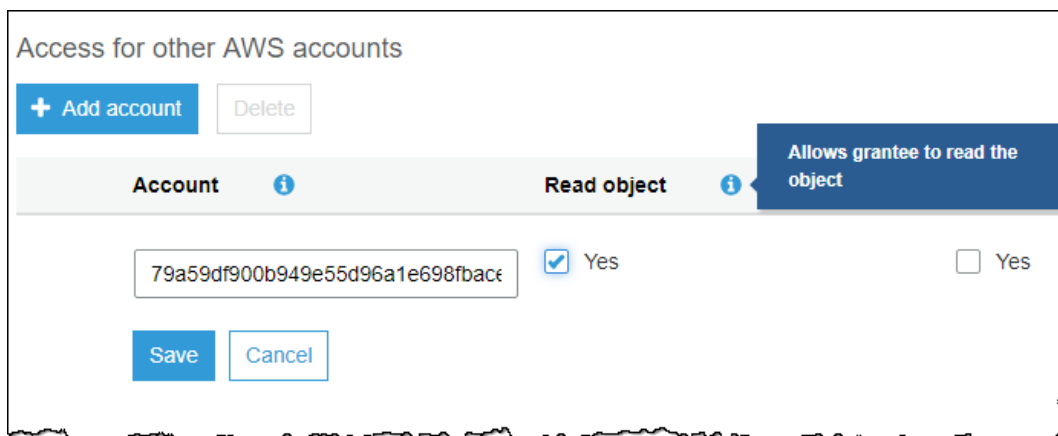

Select the check boxes for the permissions that you want to change, and then choose **Save**.

- b. **Access for other AWS accounts**

To grant permissions to an AWS user from a different AWS account, under **Access for other AWS accounts**, choose **Add account**. In the **Enter an ID** field, enter the canonical ID of the AWS user that you want to grant object permissions to. For information about finding a canonical ID, see [AWS Account Identifiers](#) in the *Amazon Web Services General Reference*. You can add as many as 99 users.

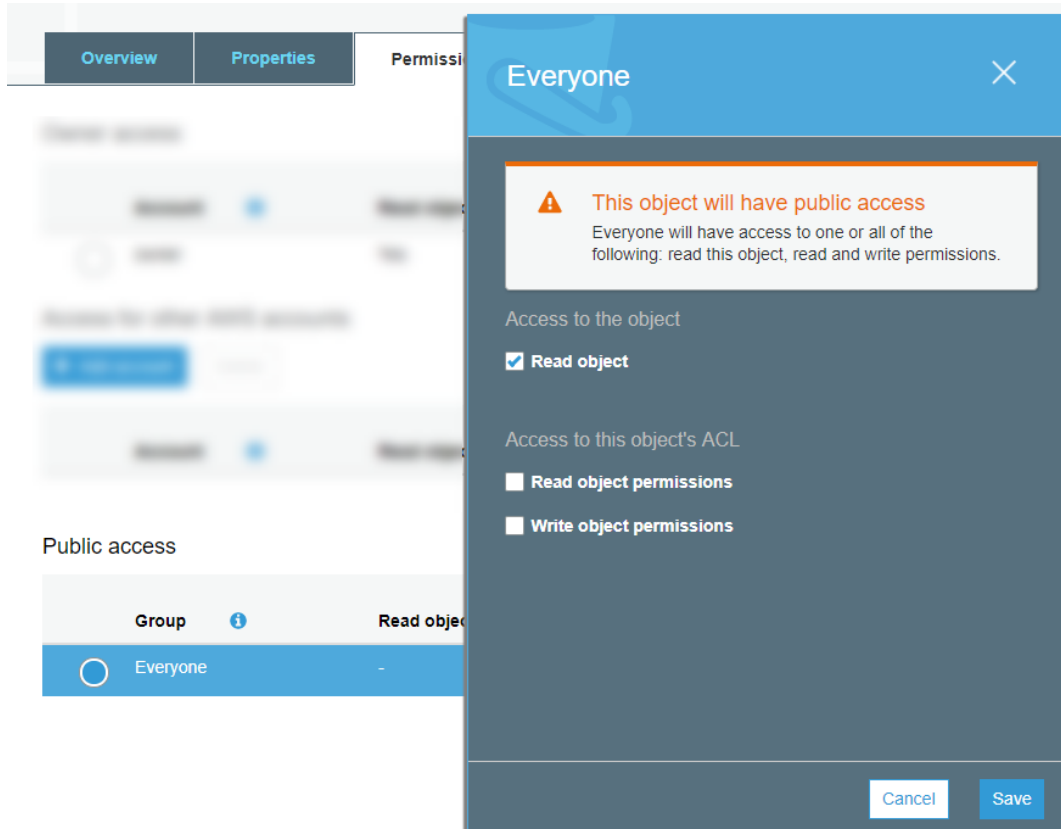

Select the check boxes for the permissions that you want to grant to the user, and then choose **Save**. To display information about the permissions, choose the Help icons.

c. **Public access**

To grant access to your object to the general public (everyone in the world), under **Public access**, choose **Everyone**. Granting public access permissions means that anyone in the world can access the object.

Select the check boxes for the permissions that you want to grant, and then choose **Save**.

Warning

Use caution when granting the **Everyone** group anonymous access to your Amazon S3 objects. When you grant access to this group, anyone in the world can access your object. If you need to grant access to everyone, we highly recommend that you only grant permissions to **Read objects**.

We highly recommend that you *do not* grant the **Everyone** group write object permissions. Doing so allows anyone to overwrite the ACL permissions for the object.

You can also set object permissions when you upload objects. For more information about setting permissions when uploading objects, see [How Do I Upload Files and Folders to an S3 Bucket?](#) (p. 38).

How Do I Set ACL Bucket Permissions?

This section explains how to use the Amazon Simple Storage Service (Amazon S3) console to manage access permissions for S3 buckets by using access control lists (ACLs). ACLs are resource-based access policies that grant access permissions to buckets and objects. For more information about managing access permissions with resource-based policies, see [Overview of Managing Access](#) in the *Amazon Simple Storage Service Developer Guide*.

You can grant permissions to other AWS account users or to predefined groups. The user or group that you are granting permissions to is called the *grantee*. By default, the owner, which is the AWS account that created the bucket, has full permissions.

For more information about ACLs, see [Managing Access with ACLs](#) in the *Amazon Simple Storage Service Developer Guide*.

To set ACL access permissions for an S3 bucket

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want to set permissions for.

3. Choose **Permissions**, and then choose **Access Control List**.
4. You can manage bucket access permissions for the following:
 - a. **Access for your AWS accounted root user**

The *owner* refers to the AWS account root user, and not an AWS Identity and Access Management (IAM) user. For more information about the root user, see [The AWS Account Root User](#) in the *IAM User Guide*.

To change the owner's bucket access permissions, under **Access for your AWS accounted root user**, choose **Your AWS Account (owner)**.

Select the check boxes for the permissions that you want to change, and then choose **Save**.

The screenshot shows the 'Access Control List' interface. At the top, there are two tabs: 'Block public access' and 'Access Control List'. Below the tabs, the section is titled 'Access for your AWS account root user'. Under this section, there is a table with columns 'Account', 'List objects', and 'Yes'. The first row is for 'Your AWS account (owner)' with a canonical ID of '79a59df900b949e55d96a1e'. The 'List objects' column has a checkmark, and the 'Yes' column has a checkmark. To the right of the table, there is a list of permissions: 'Access to the objects' (List objects, Write objects) and 'Access to this bucket's ACL' (Read bucket permissions, Write bucket permissions). All these permissions are checked.

b. **Access for other AWS accounts**

To grant permissions to an AWS user from a different AWS account, under **Access for other AWS accounts**, choose **Add account**. In the **Enter an ID** field, enter the canonical ID of the AWS user that you want to grant bucket permissions to. For information about finding a canonical ID, see [AWS Account Identifiers](#) in the *Amazon Web Services General Reference*. You can add as many as 99 users.

Select the check boxes next to the permissions that you want to grant to the user, and then choose **Save**. To display information about the permissions, choose the Help icons.

The screenshot shows the 'Access for other AWS accounts' interface. At the top, there are two buttons: '+ Add account' and 'Delete'. Below the buttons, there is a table with columns 'Account', 'List objects', 'Write objects', and 'Read bucket permissions'. The first row is for a new account with a canonical ID of '79a59df900b949e55d96a1e'. The 'List objects' column has a checkmark, and the 'Write objects' and 'Read bucket permissions' columns have unchecked checkboxes. A red arrow points to the 'List objects' column, and a tooltip box says 'Allows grantee to list the objects in the bucket'. At the bottom, there are 'Save' and 'Cancel' buttons.

Warning

When you grant other AWS accounts access to your resources, be aware that the AWS accounts can delegate their permissions to users under their accounts. This is known as *cross-account access*. For information about using cross-account access, see [Creating a Role to Delegate Permissions to an IAM User](#) in the *IAM User Guide*.

c. **Public access**

To grant access to your bucket to the general public (everyone in the world), under **Public access**, choose **Everyone**. Granting public access permissions means that anyone in the world

can access the bucket. Select the check boxes for the permissions that you want to grant, and then choose **Save**.

To undo public access to your bucket, under **Public access**, choose **Everyone**. Clear all the permissions check boxes, and then choose **Save**.

Warning

Use caution when granting the **Everyone** group public access to your S3 bucket. When you grant access to this group, anyone in the world can access your bucket. We highly recommend that you never grant any kind of public write access to your S3 bucket.

d. **S3 log delivery group**

To grant access to Amazon S3 to write server access logs to the bucket, under **S3 log delivery group**, choose **Log Delivery**.

If a bucket is set up as the target bucket to receive access logs, the bucket permissions must allow the **Log Delivery** group write access to the bucket. When you enable server access logging on a bucket, the Amazon S3 console grants write access to the **Log Delivery** group for the target bucket that you choose to receive the logs. For more information about server access logging, see [How Do I Enable Server Access Logging for an S3 Bucket?](#) (p. 16).

You can also set bucket permissions when you are creating a bucket. For more information about setting permissions when creating a bucket, see [How Do I Create an S3 Bucket?](#) (p. 3).

How Do I Add an S3 Bucket Policy?

This section explains how to use the Amazon Simple Storage Service (Amazon S3) console to add a new bucket policy or edit an existing bucket policy. A bucket policy is a resource-based AWS Identity and Access Management (IAM) policy. You add a bucket policy to a bucket to grant other AWS accounts or IAM users access permissions for the bucket and the objects in it. Object permissions apply only to the objects that the bucket owner creates. For more information about bucket policies, see [Overview of Managing Access](#) in the *Amazon Simple Storage Service Developer Guide*.

For examples of Amazon S3 bucket policies, see [Bucket Policy Examples](#) in the *Amazon Simple Storage Service Developer Guide*.

To create or edit a bucket policy

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want to create a bucket policy for or whose bucket policy you want to edit.

3. Choose **Permissions**, and then choose **Bucket Policy**.

4. In the **Bucket policy editor** text box, type or copy and paste a new bucket policy, or edit an existing policy. The bucket policy is a JSON file. The text you type in the editor must be valid JSON.

5. Choose **Save**.

Note

Amazon S3 displays the Amazon Resource Name (ARN) for the bucket next to the **Bucket policy editor** title. For more information about ARNs, see [Amazon Resource Names \(ARNs\) and AWS Service Namespaces](#) in the *Amazon Web Services General Reference*.

Directly below the bucket policy editor text box is a link to the **Policy Generator**, which you can use to create a bucket policy.

How Do I Add Cross-Domain Resource Sharing with CORS?

This section explains how to use the Amazon S3 console to add a cross-origin resource sharing (CORS) configuration to an S3 bucket. CORS allows client web applications that are loaded in one domain to interact with resources in another domain.

To configure your bucket to allow cross-origin requests, you add CORS configuration to the bucket. A CORS configuration is an XML document that defines rules that identify the origins that you will allow to access your bucket, the operations (HTTP methods) supported for each origin, and other operation-specific information. For more information about CORS, see [Cross-Origin Resource Sharing \(CORS\)](#) in the *Amazon Simple Storage Service Developer Guide*.

When you enable CORS on the bucket, the access control lists (ACLs) and other access permission policies continue to apply.

To add a CORS configuration to an S3 bucket

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the **Bucket name** list, choose the name of the bucket that you want to create a bucket policy for.

3. Choose **Permissions**, and then choose **CORS configuration**.

4. In the **CORS configuration editor** text box, type or copy and paste a new CORS configuration, or edit an existing configuration. The CORS configuration is an XML file. The text that you type in the editor must be valid XML.
5. Choose **Save**.

Note

Amazon S3 displays the Amazon Resource Name (ARN) for the bucket next to the **CORS configuration editor** title. For more information about ARNs, see [Amazon Resource Names \(ARNs\) and AWS Service Namespaces](#) in the *Amazon Web Services General Reference*.

Using Access Analyzer for S3

Access Analyzer for Amazon S3 alerts you to S3 buckets that are configured to allow access to anyone on the internet or other AWS accounts, including AWS accounts outside of your organization. For each public or shared bucket, you receive findings into the source and level of public or shared access. For example, Access Analyzer for S3 might show that a bucket has read or write access provided through bucket access control lists (ACLs), bucket policies, or both. Armed with this knowledge, you can take immediate and precise corrective action to restore your bucket access to what you intended.

When reviewing an at-risk bucket in Access Analyzer for S3, you can block all public access to the bucket with a single click. We recommend that you block all access to your buckets unless you require public access to support a specific use case. Before you block all public access, ensure that your applications will continue to work correctly without public access. For more information, see [Using Amazon S3 Block Public Access](#) in the *Amazon Simple Storage Service Developer Guide*.

You can also drill down into bucket-level permission settings to configure granular levels of access. For specific and verified use cases that require public access, such as static website hosting, public

downloads, or cross-account sharing, you can acknowledge and record your intent for the bucket to remain public or shared by archiving the findings for the bucket. You can revisit and modify these bucket configurations at any time. You can also download your findings as a CSV report for auditing purposes.

Access Analyzer for S3 is available at no extra cost on the Amazon S3 console. Access Analyzer for S3 is powered by AWS Identity and Access Management (IAM) Access Analyzer. To use Access Analyzer for S3 in the Amazon S3 console, you must visit the IAM console and enable IAM Access Analyzer on a per-Region basis.

For more information about IAM Access Analyzer, see [What is Access Analyzer?](#) in the *IAM User Guide*. For more information about Access Analyzer for S3, review the following sections.

Important

When a bucket policy or bucket ACL is added or modified, Access Analyzer generates and updates findings based on the change within 30 minutes. Findings related to account level block public access settings may not be generated or updated for up to 6 hours after you change the settings.

What Information Does Access Analyzer for S3 Provide?

Access Analyzer for S3 provides findings for buckets that can be accessed outside your AWS account. Buckets that are listed under **Buckets with public access** can be accessed by anyone on the internet. If Access Analyzer for S3 identifies public buckets, you also see a warning at the top of the page that shows you the number of public buckets in your Region. Buckets listed under **Buckets with access from other AWS accounts — including third-party AWS accounts** are shared conditionally with other AWS accounts, including accounts outside of your organization.

For each bucket, Access Analyzer for S3 provides the following information:

- **Bucket name**
- **Discovered by Access analyzer** - When Access Analyzer for S3 discovered the public or shared bucket access.
- **Shared through** - How the bucket is shared—through a bucket policy, a bucket ACL, or both. If you want to find and review the source for your bucket access, you can use the information in this column as a starting point for taking immediate and precise corrective action.
- **Status** - The status of the bucket finding. Access Analyzer for S3 displays findings for all public and shared buckets.
 - **Active** - Finding has not been reviewed.
 - **Archived** - Finding has been reviewed and confirmed as intended.
 - **All** - All findings for buckets that are public or shared with other AWS accounts, including AWS accounts outside of your organization.

- **Access level** - Access permissions granted for the bucket:
 - **List** - List resources.
 - **Read** - Read but not edit resource contents and attributes.
 - **Write** - Create, delete, or modify resources.
 - **Permissions** - Grant or modify resource permissions.
 - **Tagging** - Update tags associated with the resource.

Enabling Access Analyzer for S3

To use Access Analyzer for S3 in the Amazon S3 console, you must visit the IAM console and do the following:

- Set permissions.
- Enable IAM Access Analyzer for each Region where you want to use it.

For more information, see [Getting Started with Access Analyzer](#) in the *IAM User Guide*.

Blocking All Public Access

If you want to block all access to a bucket in a single click, you can use the **Block all public access** button in Access Analyzer for S3. When you block all public access to a bucket, no public access is granted. We recommend that you block all public access to your buckets unless you require public access to support a specific and verified use case. Before you block all public access, ensure that your applications will continue to work correctly without public access.

If you don't want to block all public access to your bucket, you can edit your block public access settings on the Amazon S3 console to configure granular levels of access to your buckets. For more information, see [Using Amazon S3 Block Public Access](#) in the *Amazon Simple Storage Service Developer Guide*.

In rare events, Access Analyzer for S3 might report no findings for a bucket that an Amazon S3 block public access evaluation reports as public. This happens because Amazon S3 block public access reviews policies for current actions and any potential actions that might be added in the future, leading to a bucket becoming public. On the other hand, Access Analyzer for S3 only analyzes the current actions specified for the Amazon S3 service in the evaluation of access status.

To block all public access to a bucket using Access Analyzer for S3

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the navigation pane on the left, under **Dashboards**, choose **Access analyzer for S3**.
3. In Access Analyzer for S3, choose a bucket.
4. Choose **Block all public access**.
5. To confirm your intent to block all public access to the bucket, in **Block all public access (bucket settings)**, enter **confirm**.

Amazon S3 blocks all public access to your bucket. The status of the bucket finding updates to **resolved**, and the bucket disappears from the Access Analyzer for S3 listing. If you want to review resolved buckets, open IAM Access Analyzer on the IAM console.

Reviewing and Changing a Bucket Policy or a Bucket ACL

If you did not intend to grant access to the public or other AWS accounts, including accounts outside of your organization, you can modify the bucket ACL, bucket policy, or both to remove the access to the bucket.

To change a bucket policy or Bucket ACL from Access Analyzer for S3

1. Open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the navigation pane, choose **Access analyzer for S3**.
3. To see whether public access or shared access is granted through a bucket policy, a bucket ACL, or both, look in the **Shared through** column.
4. Under **Bucket name**, choose the name for the bucket with bucket policy or bucket ACL that you want to change or review.
5. Choose **Permissions**.
6. If you want to change or view a bucket ACL, choose **Access Control List**.
7. If you want to change or view a bucket policy, choose **Bucket Policy**.

If you edit or remove a bucket ACL or bucket policy to remove public or shared access, the status for the bucket findings updates to resolved. The resolved bucket findings disappear from the Access Analyzer for S3 listing, but you can view them in IAM Access Analyzer.

Archiving Bucket Findings

If a bucket grants access to the public or other AWS accounts, including accounts outside of your organization, to support a specific use case (for example, a static website, public downloads, or cross-account sharing), you can archive the finding for the bucket. When you archive bucket findings, you acknowledge and record your intent for the bucket to remain public or shared. Archived bucket findings remain in your Access Analyzer for S3 listing so that you always know which buckets are public or shared.

To archive bucket findings in Access Analyzer for S3

1. Open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the navigation pane, choose **Access analyzer for S3**.
3. In Access Analyzer for S3, choose an active bucket.
4. To acknowledge your intent for this bucket to be accessed by the public or other AWS accounts, including accounts outside of your organization, choose **Archive**.
5. Enter **confirm**, and choose **Archive**.

Archive findings for bucket with public access ×

By archiving the findings for this bucket, you acknowledge that you intend for anyone in the world to be able to access this bucket. If you do not intend for this bucket to be public, use [block public access](#)  to configure secure access to your bucket. Before archiving, review the access granted to this bucket.

To confirm that you intend this bucket to be publicly accessible, enter *confirm* in the box.

Activating an Archived Bucket Finding

After you archive findings, you can always revisit them and change their status back to active, indicating that the bucket requires another review.

To activate an archived bucket finding in Access Analyzer for S3

1. Open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the navigation pane, choose **Access analyzer for S3**.
3. Choose the archived bucket findings.
4. Choose **Mark as active**.

Viewing Finding Details

If you need to see more information about a bucket, you can open the bucket finding details in IAM Access Analyzer on the IAM console.

To view finding details in Access Analyzer for S3

1. Open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the navigation pane, choose **Access analyzer for S3**.
3. In Access Analyzer for S3, choose a bucket.
4. Choose **View details**.

The finding details open in IAM Access Analyzer on the IAM console.

Downloading an Access Analyzer for S3 Report

You can download your bucket findings as a CSV report that you can use for auditing purposes. The report includes the same information that you see in Access Analyzer for S3 on the Amazon S3 console.

To download a report

1. Open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the navigation pane on the left, choose **Access analyzer for S3**.
3. In the Region filter, choose the Region.

Access Analyzer for S3 updates to shows buckets for the chosen Region.

4. Choose **Download report**.

A CSV report is generated and saved to your computer.

Earlier Updates

The following table describes the important changes in each release of the *Amazon Simple Storage Service Console User Guide* before June 19, 2018.

Change	Description	Date Changed
New storage class	Amazon S3 now offers a new storage class, ONEZONE_IA (IA, for infrequent access) for storing objects. For more information, see Storage Classes in the <i>Amazon Simple Storage Service Developer Guide</i> .	April 4, 2018
Support for ORC-formatted Amazon S3 inventory files	Amazon S3 now supports the Apache optimized row columnar (ORC) format in addition to comma-separated values (CSV) file format for inventory output files. For more information, see How Do I Configure Amazon S3 Inventory? (p. 106).	November 17, 2017

You can also configure to encrypt Amazon S3 inventory with server-side encryption (SSE) or SSE-KMS so that all inventory files are encrypted accordingly. For more information, see How Do I Configure Amazon S3 Inventory? (p. 106).	November 06, 2017
Cross-region replication enhancements	Cross-region replication now supports the following: <ul style="list-style-type: none"> By default, Amazon S3 does not replicate objects in your source bucket that are created using server-side encryption using AWS KMS-managed keys. You can now configure a replication rule to replicate these objects. For more information, see How Do I Add a Replication Rule to an S3 Bucket? (p. 85). In a cross-account scenario, you can configure a replication rule to change replica ownership to the AWS account that owns the destination bucket.
